Preface	v
1 Von Neumann algebras – An overview	1
1.1 Preliminaries	1
1.2 Basics of von Neumann algebras	2
1.3 States, weights and traces	3
1.4 Classification of von Neumann algebras	4
1.5 Tomita–Takesaki theory	5
1.6 Classification of factors of type III	6
1.7 Crossed products and type III structure theory	7
1.8 Classification of AFD factors	8
1.9 Standard form and natural positive cone	9
1.10 Developments since the 1980s	10
2 Tomita–Takesaki modular theory	13
2.1 Tomita’s fundamental theorem	13
2.2 KMS condition	20
3 Standard form	25
3.1 Definition and basic properties	25
3.2 Uniqueness theorem	32
4 τ -Measurable operators	39
4.1 τ -Measurable operators	39
4.2 Generalized s -numbers	47
4.3 L^p -spaces with respect to a trace	57
5 Conditional expectations and generalized conditional expectations	71
5.1 Conditional expectations	71
5.2 Generalized conditional expectations	79

6	Connes' cocycle derivatives	87
6.1	Basics of faithful semifinite normal weights	87
6.2	Connes' cocycle derivatives	90
7	Operator-valued weights	95
7.1	Generalized positive operators	95
7.2	Operator-valued weights	98
7.3	Pedersen–Takesaki construction	111
8	Takesaki duality and structure theory	123
8.1	Takesaki's duality theorem	123
8.2	Structure of von Neumann algebras of type III	135
9	Haagerup's L^p -spaces	139
9.1	Description of $L^1(M)$	139
9.2	Haagerup's L^p -spaces	145
9.3	Kosaki's interpolation L^p -spaces	157
10	Relative modular operators and Connes' cocycle derivatives (continued)	163
10.1	Relative modular operators	163
10.2	Connes' cocycle derivatives (continued)	172
11	Spatial derivatives and spatial L^p -spaces	181
11.1	Spatial derivatives	181
11.2	Proofs of theorems	192
11.3	Spatial L^p -spaces	202
A	Positive self-adjoint operators and positive quadratic forms	211
A.1	Positive self-adjoint operators	211
A.2	Positive quadratic forms	220
	Bibliography	231
	Index	239
