Preface	v
1 Gaussian integral operators	1
1.1 Preliminaries and notation	1
1.2 The Heisenberg group and the Weil representation of $\mathrm{Sp}(2n, \mathbb{R})$	12
1.3 Gaussian operators	19
1.4 The product of Gaussian operators	26
1.5 A little linear symplectic geometry	29
1.6 Gaussian operators and Lagrangian subspaces	33
1.7 Linear relations. Emulation of basic definitions of matrix theory	37
1.8 The symplectic category	44
1.9 The symplectic category. Details	46
1.10 Proof of boundedness. Canonical forms of Gaussian operators	52
1.11 Bibliographical remarks	55
2 Pseudo-Euclidean geometry and groups $\mathrm{U}(p, q)$	57
2.1 The geometry of indefinite Hermitian forms	57
2.2 Pseudo-unitary groups $\mathrm{U}(p, q)$	67
2.3 Cartan matrix balls	76
2.4 The space $\mathrm{U}(n)$. Cell decomposition	86
2.5 Jordan angles and the Hua double ratio	92
2.6 Classification of pseudo-unitary and pseudo-self-adjoint operators	100
2.7 Indefinite contractions	109
2.8 Potapov coordinates	117
2.9 The Krein–Shmul’yan category. The compression property	122
2.10 Isotropic category. Inverse limits	127
2.11 Kähler metrics on matrix balls. Some matrix tricks	137
2.12 Matrix balls as symmetric spaces	142
Addendum 1 to Section 2. Blaschke–Potapov factorizations and operator colligations	147
α . Potapov multiplicative integral	147
β . Operator colligations and the spectral theory of almost unitary operators	151
γ . The space of rational curves in Grassmannians	154
Addendum 2 to Section 2. The triangle inequality and the Klyachko theorem	155

3 Linear symplectic geometry	159
3.1 Symplectic groups	159
3.2 The group $\mathrm{Sp}(2n, \mathbb{R})$ in a complex model	163
3.3 Matrix balls	167
3.4 Conjugacy classes in $\mathrm{Sp}(2n, \mathbb{R})$	173
3.5 Symplectic contractions	182
3.6 The symplectic category and the isotropic category	184
3.7 Central extensions of groups $\mathrm{Sp}(2n, \mathbb{R})$. Berezin's formula	184
3.8 Central extensions. The Krein–Shmul'yan category	190
3.9 Geodesic triangles	192
3.10 Digression. Central extensions of groups of symplectomorphisms	198
3.11 Central extensions. The Maslov index	201
Addendum to Section 3.3. Lie semigroups and convex cones	209
α . Invariant convex cones in classical Lie algebras	209
β . Lie semigroups	211
γ . Causal structures (orders) on homogeneous spaces	214
δ . Total positivity	220
3.12 Bibliographical remarks to Chapters 2 and 3	220
4 The Segal–Bargmann transform	226
4.1 Fock space	226
4.2 The Segal–Bargmann transform	234
4.3 Spectral analysis of signals	240
4.4 Spectral analysis of singularities	249
4.5 Symbols of operators	258
4.6 The Perelomov problem	266
4.7 Preliminaries on θ -functions	270
4.8 Interpolation and the Lagrange formula	275
4.9 Inversion of the Segal–Bargmann transform from points of a lattice	278
4.10 Bibliographical remarks	284
5 Gaussian operators in Fock spaces	286
5.1 Gaussian operators	286
5.2 Proof of the formula for products	291
5.3 Boundedness. Spectra of self-adjoint Gaussian operators	296
5.4 Bibliographical remarks	300
6 Gaussian operators. Details	301
6.1 Canonical forms and invariants	301
6.2 Norms	305
6.3 Spectra and eigenvectors	308
6.4 Quadratic operators and exponentials	312

6.5	Matching functions and matrix elements of Gaussian operators	315
6.6	Analytic continuation	320
6.7	Bibliographical remarks	321
7	Hilbert spaces of holomorphic functions in matrix balls	322
7.1	Reproducing kernels	322
7.2	Highest weight representations of $SU(1, 1)$	331
7.3	Hilbert spaces of holomorphic functions	337
7.4	Multipliers and invariant kernels	343
7.5	The Berezin scale	347
7.6	Hardy spaces on Siegel wedges	365
7.7	Realization of the Weil representation in holomorphic functions on a matrix ball	370
7.8	Determinantal systems of differential equations	374
7.9	The symplectic category and the spaces \mathcal{H}_α	377
7.10	Bibliographical remarks	379
8	The Cartier model	381
8.1	The Zak transform	381
8.2	The pushforward of the Fourier transform	386
8.3	Action of $Sp(2n, \mathbb{Z})$	390
8.4	Theta-functions and theta-distributions	399
8.5	Theta-kernels	402
8.6	Bibliographical remarks	407
9	Gaussian operators over finite fields	408
9.1	Classification of quadratic forms	408
9.2	The Fourier transform and Gauss sums	411
9.3	Gaussian quadratic sums	417
9.4	Gaussian operators	418
9.5	Fast Fourier transform	422
9.6	Bibliographic remarks	426
10	Classical p-adic groups. Introduction	427
10.1	p -adic numbers	427
10.2	Classification of quadratic forms	433
10.3	Lattices	441
10.4	Bruhat–Tits trees	447
10.5	Bruhat–Tits buildings	449
10.6	Buildings related to symplectic groups	457
10.7	The Nazarov category	460
10.8	Buildings. General comments	464
$\alpha.$	Coxeter groups	464

β . Axioms and basic properties of buildings	466
γ . Real symmetric spaces and the Tits metric	472
11 Weil representation over a p-adic field	476
11.1 Gaussian integrals over a p -adic field	476
11.2 Weil representation, p -adic case	482
11.3 Adeles	488
11.4 Adelic Weil representation	492
11.5 The group $\mathrm{Sp}(2n, \mathbb{Q})$ and the real-adelic correspondence	495
11.6 Constructions of modular forms	499
11.7 Bibliographical remarks to Chapters 10 and 11	504
Addendum	507
A. Classical groups. Notation	507
B. Representations. Several definitions	511
C. Lie groups. Several logical arrows	515
D. Classical symmetric spaces. Tables	521
Bibliography	537
Notation	549
Index	553
