Contents

1 Introduction 1
- 1.1 Historical overview 1
- 1.2 Push-forward of measures 2
- 1.3 Basics of Riemannian geometry 5
- 1.4 Transport maps 7
- 1.5 An application to isoperimetric inequalities 14
- 1.6 A Jacobian equation for transport maps 16

2 Optimal transport 17
- 2.1 Preliminaries in measure theory 17
- 2.2 Monge vs. Kantorovich 24
- 2.3 Existence of an optimal coupling 24
- 2.4 c-cyclical monotonicity 26
- 2.5 The case $c(x, y) = \frac{|x-y|^2}{2}$ on $X = Y = \mathbb{R}^d$ 29
- 2.6 General cost functions: Kantorovich duality 49
- 2.7 General cost functions: Existence and uniqueness of optimal transport maps 55

3 Wasserstein distances and gradient flows 59
- 3.1 p-Wasserstein distances and geodesics 59
- 3.2 An informal introduction to gradient flows in Hilbert spaces 66
- 3.3 Heat equation and optimal transport: The JKO scheme 71

4 Differential viewpoint of optimal transport 83
- 4.1 The continuity equation and Benamou–Brenier formula 83
- 4.2 Otto's calculus: From Benamou–Brenier to a Riemannian structure . . 86
- 4.3 Displacement convexity 91
- 4.4 An excursion into the linear Fokker–Planck equation 94

5 Further reading 103
- 5.1 Functional and geometric inequalities 104
- 5.2 Probability 106
- 5.3 Multi-marginal optimal transport 109
- 5.4 Gradient flows 111
- 5.5 Regularity theory 112
- 5.6 Computational aspects 114
- 5.7 From $\mathbb{R}^d$ to Riemannian manifolds and beyond: CD spaces 116

A Exercises on optimal transport (with solutions) 119

B Disintegrating the disintegration theorem 141
