Preface to the second edition	v
Preface	vii
Notation and conventions	ix
Introduction	1
1 Some classical diophantine examples	5
1.1 The case of a single variable	5
1.2 The linear case in two variables	9
1.3 Diophantine approximation	14
1.4 Pell equation	25
1.5 The general binary equation of degree 2	52
1.6 Basics of reduction theory for binary quadratic forms	60
Supplements to Chapter 1	66
Notes to Chapter 1	94
2 Thue's equations and rational approximations	97
2.1 Thue equations	97
2.2 Rational approximations to algebraic numbers	105
2.3 Thue's method and later developments	111
2.4 Proof of Thue's approximation theorem	118
Supplements to Chapter 2	132
Notes to Chapter 2	164
3 Heights and diophantine equations over number fields	169
3.1 Fields with a product formula	170
3.2 Heights	175
3.3 Some diophantine analysis over number fields	203
3.4 Heights on finitely generated subgroups of \mathbb{G}_m^n	220
Supplements to Chapter 3	228
Notes to Chapter 3	260
4 Heights on subvarieties of \mathbb{G}_m^n	265
4.1 A problem of Lang's and points of small height	266

4.2	Lattices and algebraic subgroups	271
4.3	Heights on subvarieties of \mathbb{G}_m^n	285
4.4	An application to the S -unit equation	300
	Supplements to Chapter 4	305
	Notes to Chapter 4	324
5	The S-unit equation	327
5.1	A quantitative S -unit theorem	327
5.2	Padé approximations	330
5.3	Proof of Theorem 5.1.1	336
5.4	Applications to Thue–Mahler equations	343
5.5	Miscellaneous applications to heights, pencils of diophantine equations, and linear recurrences	346
	Notes to Chapter 5	358
	Index	361
	References	365
A	Francesco Amoroso: Lower bounds for the height	373
A.1	Introduction	373
A.2	Algebraic numbers	374
A.3	Subvarieties of \mathbb{G}_m^n	385
	References for the appendix	397
