Foreword	v
Introduction to Teichmüller theory, old and new, II by Athanase Papadopoulos	1
Part A. The metric and the analytic theory, 2	
Chapter 1. The Weil-Petersson metric geometry by Scott A. Wolpert	47
Chapter 2. Infinite dimensional Teichmüller spaces by Alastair Fletcher and Vladimir Markovic	65
Chapter 3. A construction of holomorphic families of Riemann surfaces over the punctured disk with given monodromy by Yoichi Imayoshi	93
Chapter 4. The uniformization problem by Robert Silhol	131
Chapter 5. Riemann surfaces, ribbon graphs and combinatorial classes by Gabriele Mondello	151
Chapter 6. Canonical 2-forms on the moduli space of Riemann surfaces by Nariya Kawazumi	217
Part B. The group theory, 2	
Chapter 7. Quasi-homomorphisms on mapping class groups by Koji Fujiwara	241
Chapter 8. Lefschetz fibrations on 4-manifolds by Mustafa Korkmaz and András I. Stipsicz	271

Chapter 9. Introduction to measurable rigidity of mapping class groups by Yoshikata Kida	297
Chapter 10. Affine groups of flat surfaces by Martin Möller	369
Chapter 11. Braid groups and Artin groups by Luis Paris	389
Part C. Representation spaces and geometric structures, 1	
Chapter 12. Complex projective structures by David Dumas	455
Chapter 13. Circle packing and Teichmüller space by Sadayoshi Kojima	509
Chapter 14. $(2 + 1)$ Einstein spacetimes of finite type by Riccardo Benedetti and Francesco Bonsante	533
Chapter 15. Trace coordinates on Fricke spaces of some simple hyperbolic surfaces by William M. Goldman	611
Chapter 16. Spin networks and $\mathrm{SL}(2, \mathbb{C})$ -character varieties by Sean Lawton and Elisha Peterson	685
Part D. The Grothendieck–Teichmüller theory	
Chapter 17. Grothendieck’s reconstruction principle and 2-dimensional topology and geometry by Feng Luo	733
Chapter 18. Dessins d’enfants and origami curves by Frank Herrlich and Gabriela Schmithüsen	767

Chapter 19. The Teichmüller theory of the solenoid by Dragomir Šarić	811
List of Contributors	857
