1	Introduction	1
1.1	Statement of the main results	2
1.2	Comments and previous results	8
1.3	Motivation from recirculation problems in fluid mechanics	13
1.4	Scheme of proof of nonlinear theorems and plan of the memoir	16
1.5	Functional spaces and interpolation results	19
2	The case of the linear shear flow	23
2.1	Existence and uniqueness of weak solutions	23
2.2	Strong solutions with maximal regularity	24
2.3	Orthogonality conditions for higher tangential regularity	25
2.4	Singular radial solutions in the half-plane and profile decomposition	33
2.5	Interpolation and fractional regularity	46
3	A first nonlinear example in kinetic theory	49
3.1	Description of the model and main result	49
3.2	Well-posedness theory with low regularity	51
3.3	Nonlinear orthogonality conditions for higher regularity	53
3.4	Regularity and tangent space of the manifold	56
3.5	A general formalization	59
4	A viscous Burgers equation	63
4.1	A nonlinear change of variables	63
4.2	Well-posedness in the new variables	65
4.3	Reverse change of variables	73
5	The Prandtl system in the recirculation zone	75
5.1	Nonlinear change of variables	77
5.2	The linearized vorticity equation	82
5.3	Reconstructing the velocity from the vorticity	88
5.4	Local nonlinear well-posedness in the new variables	93
5.5	Well-posedness of the Prandtl system	97
5.6	Potential strategy in a whole infinite strip	100
6	Interpolation estimate for the linear shear flow problem	105
6.1	A primer on subspace interpolation	105

6.2	Interpolated theory in the case of the linear shear flow	109
A	Uniqueness of weak solutions for linear problems	117
B	Proofs of functional analysis results	119
B.1	An abstract existence principle	119
B.2	Product and composition rules in Sobolev spaces	120
B.3	Extension operators	124
B.4	Embeddings	125
C	Unconditional regularity away from lateral boundaries	129
	List of notations	133
	References	137
