Preface	vii
1 Introduction by examples	1
2 A basic eigenvalue optimization problem	13
2.1 Problem formulation	13
2.2 Gradient flow	15
2.3 Rank-1 constrained gradient flow	21
2.4 Notes	34
3 Pseudospectra	37
3.1 Complex ε -pseudospectrum	37
3.2 Computing the pseudospectral abscissa	42
3.3 Tracing the boundary of the pseudospectrum	54
3.4 Notes	59
4 Two-level approaches to matrix nearness problems	63
4.1 Problem setting	64
4.2 Nested iteration	65
4.3 Alternating between optimization and root-finding: HEC algorithm ..	76
4.4 Computing the stability radius	78
4.5 Notes	79
5 Real and structured perturbations	83
5.1 Real version of the eigenvalue optimization problem	84
5.2 Structured eigenvalue optimization problems	91
5.3 Structured pseudospectra	99
5.4 Computing the structured stability radius	104
5.5 Transient dynamics under structured perturbations	105
5.6 Computing the structured ε -stability radius	108
5.7 Numerical range under structured perturbations	113
5.8 Structured distance to singularity	118
5.9 Notes	128

6	Matrix nearness problems of diverse kinds	133
6.1	Matrix stabilization	134
6.2	Hamiltonian matrix nearness problems	145
6.3	Nearest defective matrix	160
6.4	Nearest singular matrix pencil	170
6.5	Stability radii for delay differential equations	175
6.6	Kreiss number	183
6.7	Notes	187
7	Systems and control	193
7.1	Problem formulation	193
7.2	$\mathcal{H}_\infty$ -norm of the matrix transfer function	194
7.3	$\mathcal{H}_\infty$ -robustness of controllability	208
7.4	Nearest passive system	213
7.5	Structured contractivity radius	220
7.6	Descriptor systems	223
7.7	Notes	229
8	Graphs	233
8.1	Cutting edges	233
8.2	Toppling the ranking	246
8.3	Notes	252
A	Derivatives of eigenvalues and eigenvectors	255
A.1	Derivative of paths of simple eigenvalues	255
A.2	Derivative of paths of eigenvectors	256
	References	259
	Index	271
