Preface v

Part I A brief introduction to hydrodynamic stability in incompressible fluids **1**

1 The incompressible Navier–Stokes and Euler equations 3
1.1 The momentum equations 3
1.2 Boundary conditions 3
1.3 The pressure, the Leray projector, and the Stokes operator 5
1.4 Vorticity 7
1.5 Conservation laws and symmetries 9
1.6 Basic local and global regularity results 11

2 An introduction to hydrodynamic stability 13
2.1 What is stability? 14
2.2 Some classical hydrodynamic stability problems 15

Part II Linearized theory **21**

3 Spectral vs. linear stability 23

4 Basic considerations and case studies 27
4.1 Linearized 2D shear flows in vorticity form without viscosity 27
4.2 The 2D Couette flow 28
4.3 Convex shear flows and the Kolmogorov flow 33
4.4 Strictly monotone decreasing vortices 35
4.5 The Kelvin–Helmholtz instability 35
4.6 The 3D Couette flow 37

5 Inviscid problems: Rayleigh's equation 43
5.1 Rayleigh's equation and the resolvent 43
5.2 The point spectrum of shear flows 44
5.3 The essential spectrum of shear flows: Inviscid damping 47

6 Case study: Long wave instabilities 51
6.1 The class $\mathcal{K}^+$ and variational proofs of stability 51
6.2 Tollmien's near-neutral mode instability 52
6.3 Step 1: Constructing the solutions to the Lyapunov–Schmidt system . 56
6.4 Step 2: Finding the correct solutions 59

7 Case study: Sharp inviscid damping estimates for strictly monotone shear flows in $\mathbb{T} \times \mathbb{R}$ 65
7.1 A profile regularity method 65
7.2 A convenient change of variables 66
7.3 Regularity estimates on the resolvent 67
7.4 Higher regularity estimates on Θ_k 76
7.5 The limiting absorption principle 80

8 Viscous problems: The Orr–Sommerfeld equation 83
8.1 The Orr–Sommerfeld problem in a channel 83
8.2 Spectra in the inviscid limit 86
8.3 A few remarks about 3D plane-parallel shear flows 90

9 Case study: Self-similar Oseen vortex 95

10 Case study: Couette flow in a channel 99

11 Case study: Boundary-driven instabilities 105
11.1 The function spaces and operator estimates 107
11.2 Constructing the four solutions 111
11.3 The dispersion relation 113

12 A brief survey of other linearized results 115

Part III Inviscid nonlinear theory **117**

13 Variational methods for nonlinear stability 119
13.1 Case study: Strictly convex (or concave) shear flows in a channel . . . 119
13.2 Case study: Monotone vortices in $\mathbb{R}^2$ 123

14 Case study: Nonlinear inviscid damping for the 2D Couette flow 127
14.1 The return of the Orr mechanism 128
14.2 Paraproducts in Gevrey regularity 133
14.3 The nonlinear proof: Fourier multiplier norm 135

14.4 The nonlinear proof: Nonlinear change of coordinates 141

Part IV Viscous nonlinear theory **147**

15 Quantitative stability thresholds 149

16 Case study: Stability thresholds for 2D Couette flow 153
16.1 An easy estimate of the threshold in Sobolev spaces 155
16.2 The Fourier multiplier norm 156
16.3 The nonlinear transition threshold 160

17 Case study: Subcritical transition in the 3D Couette flow 163
17.1 Theorem statement and discussion 163
17.2 What is the right set of unknowns? 165
17.3 The coordinate change 167
17.4 The toy model 171
17.5 The norms 174

18 A brief survey of other nonlinear (in)stability results 177

Appendix **181**

A Fourier analysis 181

B Sobolev spaces 183
B.1 Fourier characterization of Sobolev norms 183
B.2 Sobolev spaces of negative regularity 184
B.3 Sobolev embeddings 185

C Gevrey and analytic regularity 187

D Airy functions 189

E Theory of linear operators 191
E.1 Spectra and resolvents 191
E.2 Semigroup theory 193
