A Remark on the Qualitative Spectral Theory of Sturm-Liouville Operators

## E. MÜLLER-PFEIFFER

Bezeichnet  $N(\Lambda)$  die größte Anzahl der Nullstellen nichttrivialer Lösungen der Sturm-Liouvilleschen Gleichung

$$
\bullet \qquad - (p(x) \; u')' + q(x) \; u = \Lambda u, \qquad -\infty \leq \dot{a} < x < b \leq \infty,
$$

so ist unter einer gewissen Voraussetzung die Anzahl der unterhalb A gelegenen Eigenwerte eines bestimmten selbstadjungierten Operators (Friedrichssche Erweiterung) gleich  $N(A) - 1$ .

Если  $N(A)$  - наибольшее число нулей нетривиальных решений уравнения Штурма-Лиувилля

$$
-(p(x) u')' + q(x) u = Au, \quad -\infty \leq a < x < b \leq \infty,
$$

то при некотором предположении число собственных значений одного самосопряженного оператора (расширения Фридрихса), меньших  $\Lambda$ , равно  $N(\Lambda) = 1$ .

If  $N(A)$  denotes the maximal number of zeros of the non-trivial solutions of the Sturm-Liouville equation

$$
-(p(x) u')' + q(x) u = \Lambda u, \quad -\infty \leq a < x < b \leq \infty,
$$

then under some hypothesis the number of eigenvalues of a special selfadjoint operator (Friedrichs extension) is equal to  $N(A) - 1$  below  $A$ .

Consider the Sturm-Liouville expression

$$
\mathscr{A}\varphi = -\big(p(x)\,\varphi'\big)'+q(x)\,\varphi,\qquad -\infty\leq a
$$

and the symmetric operator

$$
A_0\varphi = \mathscr{A}\varphi, \qquad \varphi \in D(A_0) = C_0^{\infty}(a, b),
$$

## where

 $p(x) > 0$ ,  $a < x < b$ ,  $p \in C^1$ , q real and  $q \in C$ .

Concerning the symmetric forms

$$
a[\varphi, \psi] = \int_a^b p\varphi' \overline{\psi}' dx + \int_a^b q\varphi \overline{\psi} dx, \qquad \varphi, \psi \in C_0^{\infty}(a, b),
$$
  

$$
a^+[\varphi, \psi] = \int_a^b p\varphi' \overline{\psi}' dx + \int_a^b q^+ \varphi \overline{\psi} dx, \qquad \varphi, \psi \in C_0^{\infty}(a, b),
$$
  

$$
q^+(x) = \max_{a} (q(x), 0), \qquad q^-(x) = \min_{a} (q(x), 0),
$$
  

$$
(q^- \varphi, \psi) = \int_a^b q^- \varphi \overline{\psi} dx, \qquad \varphi, \psi \in C_0^{\infty}(a, b),
$$

assume the inequality

the inequality  
\n
$$
|(q^-\varphi, \varphi)| \leq c_1 a^+ [\varphi, \varphi] + c_2 \|\varphi\|^2, \qquad \varphi \in C_0^{\infty}(a, b),
$$
\n
$$
\leq c_1 < 1 \text{ and } 0 \leq c_2 \quad (\ldots) \text{ and } \|\cdot\| \text{ denote inner product and norm in the}
$$

FEIFFER<br> *c*<sub>1</sub> $a^{\dagger}[\varphi, \varphi] + c_2 ||\varphi||^2$ ,  $\varphi \in C_0^{\infty}(a, b)$ , (1)<br>  $0 \leq c_2$ ,  $(\cdot, \cdot)$  and  $||\cdot||$  denote inner product and norm in the<br> *From* (1) it follows that the operator  $A_0$  is bounded from below.<br>
chs extensio with  $0 \leq c_1 < 1$  and  $0 \leq c_2$ .  $(\cdot, \cdot)$  and  $||\cdot||$  denote inner product and norm in the Hilbert space  $L_2(a, b)$ . From (1) it follows that the operator  $A_0$  is bounded from below. Let *A* be the Friedrichs extension of  $A_0$ . We assume in the following that there are eigenvalues  $\lambda_k$ ,  $k = 1, 2, ..., K$  ( $K \leq \infty$ ), below the essential spectrum  $\sigma_{\rm e}(A)$  of A. There are connections between the number of zeros of certain solutions of the differential equation

$$
\mathscr{A}u = \Lambda u, \quad -\infty < \Lambda < \infty,
$$

on the one hand, and the number of eigenvalues below  $\Lambda$  of self-adjoint extensions of *A0* on the other hand (see [1: pp. 1480, 1481]). In the following case where the Friedrichs extension  $A$  is considered these connections will be described more precisely. **inctual equation**<br> **infinitely many points of the spectrum of A.**  $A$  is denoted by  $A$  on the one hand, and the number of eigenvalues below  $A$  of self-adjoint extension of  $A_0$  on the other hand (see [1: pp. 1480, 148 **22 Example 1 22 Externsions** the number of eigenvalues below  $\Lambda$  of self-adjoint extensions the other hand (see [1: pp. 1480, 1481]). In the following case where the sextension  $\Lambda$  is considered these connections

<sup>r</sup> I he orem: *Consider all solutions of the differential equation* 

$$
\mathscr{A}u = Au, \qquad a < x < b, \qquad -\infty < A < \infty
$$

*and let N(A) 'be the maximum number of zeros of the different non-trivial solutions on*   $(a, b)$ . If  $N(A)$  is finite, then there exist exactly  $N(A) - 1$  eigenvalues of the operator A *on the interval*  $(-\infty, \Lambda)$ . In the case where  $N(\Lambda) = \infty$  the interval  $(-\infty, \Lambda)$  contains infinitely many points of the spectrum of A.

Proof: Let the spectrum of *A* be denoted by  $\sigma(A)$  and suppose

$$
\lambda_k < \Lambda \le \inf \sigma_{\mathfrak{a}}(A), \qquad (\lambda_k, \Lambda) \cap \sigma(A) = \emptyset. \tag{2}
$$

The eigenvalues  $\lambda_k$  ( $k = 1, 2, ...$ ) are to be denumerated in ascending order. Note that each  $\lambda_k$  is a simple eigenvalue of A. A can be a regular point of A, an eigenvalue  $(A = \lambda_{k+1})$ , or A can be equal to the lowest point of  $\sigma_e(A)$ . The eigenfunction  $u_k$  belonging to  $\lambda_k$  has exactly  $k-1$  zeros on  $(a, b)$  [1: p. 1480]. By these zeros  $x_i$ ,  $j = 1, ..., k-1$ , the interval  $(a, b)$  is divided into k subintervals  $(x_{j-1}, x_j), j = 1, ..., k$ ,  $x_0 = a$ ,  $x_k = b$ . By Sturm's comparison theorem, that can also be applied to the intervals  $(a, x_1)$  and  $(x_{k-1}, b)$  under the hypothesis (1) [2], a solution of  $\mathscr{A}u = Au$  realizing the maximum number  $N(A)$  of zeros has at least k zeros on  $(a, b)$ , because  $u_A$  has at least one zero on each interval  $(x_{i-1}, x_i)$ . By using a non-trivial solution  $u_A$  vanishing at  $x_1$ , for instance, one easily can see that  $u_A$  has at least  $k + 1$  zeros. Let us now assume that a not identically vanishing solution  $u<sub>A</sub>$  has at least  $k + 2$  zeros on The eigenvalues  $\lambda_k$  ( $k = 1, 2, \ldots$ ) are to be denumerated in ascending order. Neach  $\lambda_k$  is a simple eigenvalue of  $A$ .  $A$  can be a regular point of  $A$ , an eigenfunctiolonging to  $\lambda_k$  has exactly  $k - 1$  zeros on  $(a,$  $\zeta_{k+2}$   $\zeta$  *b*. Then on the interval  $(\xi_1, \xi_{k+2})$  there are *k* zeros of  $u_A$ . The restriction  $\tilde{u}$ of  $u_A$  to  $(\xi_1, \xi_{k+2})$  is an eigenfunction of the Friedrichs extension  $\tilde{A}$  of the operator  $(a, b)$  and let  $\xi_1, \ldots, \xi_{k+2}$  be the first  $k+2$  of these zeros such that  $a < \xi_1 < \cdots$ 

$$
\widetilde{A}_0\varphi = \mathscr{A}\varphi, \qquad \varphi \in D(\widetilde{A}_0) = C_0^{\infty}(\xi_1, \xi_{k+2}),
$$

belonging to the eigenvalue A. A is the  $(k + 1)$ th eigenvalue of  $\vec{A}$ . Hence to the left of *A* there are *k* eigenvalues of  $\tilde{A}$ . We set  $\xi_1 = \alpha$  and  $\xi_{k+2} = \beta$  and consider  $\alpha$  and  $\beta$ as parameters. If the endpoints  $\alpha$  and  $\beta$  of the interval  $(\alpha, \beta)$  tend strictly monotone to *a* and *b*, respectively, then the eigenvalues of the Friedrichs extension  $A_{\alpha,\beta}$  of the - operator *e* eigenvalue A. A is the  $(k$ <br>
eigenvalues of  $\tilde{A}$ . We set *d*<br>
f the endpoints  $\alpha$  and  $\beta$  of<br>
ectively, then the eigenvalu<br>  $= \mathscr{A}\varphi$ ,  $\qquad \varphi \in D(A_{\alpha,\beta,0}) =$ <br>
easing (the spectrum of  $A_{\alpha,\beta}$ 

$$
A_{\alpha,\beta,0}\varphi = \mathscr{A}\varphi\,,\qquad \varphi\in D(A_{\alpha,\beta,0})=C_0^\infty(\alpha,\beta)\,,
$$

are strictly decreasing (the spectrum of  $A_{\alpha,\beta}$  is discrete) [3]. Thus, it follows that there exist at least  $k + 1$  eigenvalues of the operator *A* to the left of *A*. In view of (2),

however, we have only *k* eigenvalues of *A* to the left of *A*. Consequently, a solution  $u_A$ realizing the maximum number  $N(A)$  has exactly  $k + 1$  zeros on  $(a, b)$ . Hence, the equality  $k = N(A) - 1$  is proved. Spectral Theory of Sturn<br>wever, we have only k eigenvalues of A to the left of A,<br>alizing the maximum number  $N(A)$  has exactly  $k + 1$ <br>uality  $k = N(A) - 1$  is proved.<br>To handle the case<br> $(-\infty, A) \cap \sigma(A) = \emptyset$ <br>non-trivial solutio Spectral The<br>
we have only *k* eigenvalues of *A* to the<br>
the maximum number  $N(A)$  has exactle  $k = N(A) - 1$  is proved.<br>
dle the case<br>  $(-\infty, A) \cap \sigma(A) = \emptyset$ <br>
vial solution  $u_A$  of  $\mathscr{A}u = Au$  will b<br>
ig any zero on  $(a, b)$ . By

 

$$
(-\infty, \Lambda) \cap \sigma(A) = \emptyset
$$

a non-trivial solution  $u_A$  of  $\mathscr{A}u = \Lambda u$  will be compared with the eigenfunction  $u_1$ not having any zero on  $(a, b)$ . By assuming that  $u<sub>A</sub>$  has two zeros on  $(a, b)$  the Sturm. comparison theorem implies that  $u_1$  has at least one zero between the zeros of  $u_4$ . Since this situation is impossible, the solution  $u_4$  has at most one zero on  $(a, b)$ . Of course, a zero of a non-trivial solution  $u<sub>A</sub>$  of  $\mathscr{A}u = \Lambda u$  can be realized on  $(a, b)$ . Thus, we have  $N(A) - 1 = 0$ . To handle the case<br>  $(-\infty, \Lambda) \cap \sigma(A) = \emptyset$ <br>
a non-trivial solution  $u_A$  of  $\mathscr{A}u = Au$  will be compared with the<br>
not having any zero on  $(a, b)$ . By assuming that  $u_A$  has two zeros on<br>
comparison theorem implies that  $u_1$ 

Finally, let  $N(\Lambda) = \infty$  and consider a non-trivial solution  $u_{\Lambda}$  of  $\mathscr{A}u = \Lambda u$ . Assume that there are only finite points of the spectruni of *A* below *A.* These points are of  $u_A$  such that that there are only finite points of the spectrum of A below A. These points are eigenvalues of A, say  $\lambda_1, \ldots, \lambda_k$ . Choose  $k + 2$  zeros  $\xi_1, \ldots, \xi_{k+2}$  of  $u_A$  such that  $a < \xi_1 < \cdots < \xi_{k+2} < b$  and consider the inter  $a < \xi_1 < \cdots < \xi_{k+2} < b$  and consider the interval  $(\xi_1, \xi_{k+2})$ . Now, we have the situation as above and, analogously, we can conclude that there are at least  $k+1$ eigenvalues of *A* below *A*. This contradicts the hypothesis that there are only  $k$  $(-\infty, A) \cap \sigma(A) = \emptyset$ <br>a non-trivial solution  $u_A$  of  $\mathscr{A}u = Au$  will be compared with the eigenfunction<br>not having any zero on  $(a, b)$ . By assuming that  $u_A$  has two zeros on  $(a, b)$  the Stu<br>comparison theorem implies that If there are only finite points of the spectrum of<br>envalues of A, say  $\lambda_1, ..., \lambda_k$ . Choose  $k + 2$  zerc<br> $\zeta_1 < \cdots < \zeta_{k+2} < b$  and consider the interval<br>ation as above and, analogously, we can conclude<br>envalues of A below A
