## On Function Spaces Related to Finite Element Approximation Theory

P. Oswald

Es werden mit Hilfe von finiten Dreieckselementen auf einem zweidimensionalen Gebiet Funktionenräume vom Besov-Typ eingeführt und untersucht. Diese Räume ermöglichen einen systematischen Zugang zu den grundlegenden Approximationsabschätzungen für finite Elemente in Besov-Sobolev-Normen, zum Problem der Approximationsverbesserung durch angepaßte Wahl der Triangulation und zu asymptotischen Fehlerschätzungen für elliptische Randwertprobleme.

Введены и исследованы некоторые функциональные пространства типа Бесова на основе треугольных конечных элементов в двухмерной области. Эти пространства позволяют систематически подходить к основным неравенствам теории аппроксимации конечными элементами в нормах классов типа Бесова-Соболева, к проблеме улучшения приближенин за счёт подходящего выбора триангуляции и к оценкам ошибки для эллиптических краевых задач.

Certain function spaces of Besov type based on triangular finite elements in a two-dimensional domain are introduced and investigated. These spaces allow a systematic approach to the main estimates of finite element approximation theory in Besov-Sobolev norms, to the problem of improving the rate of approximation by choosing appropriate triangulations, and to asymptotic error estimates for elliptic boundary value problems.

The aim' of this paper is to describe some results on finite element approximation in Besoy-Sobolev norms. For simplicity, we concentrate on  $C^0$ -elements of type  $(k)$ over regular triangulations of a bounded plane polygonal domain. Starting from a finite element approximation scheme corresponding to a certain sequence of quasiuniform triangulations of  $G$ , we introduce a scale of approximation spaces which allow a direct approach to questions of finite element approximation theory. It turns out that this scale is closely related to the usual Besov-Sobolev spaces.

In this way we are able to give straightforward proofs of some basic inequalities used in the finite element error estimation theory. Moreover, some new results on improved-rates for nonlinear approximation by finite elements with "free" triangulation are included. We close with a short discussion of applications to error estimates for the finite element method for elliptic boundary value problems.

1. Finite element approximation schemes and function spaces

Let G be a bounded polygonal domain in  $\mathbb{R}^2$  and denote by  $d_i$  and  $\omega_i$ , the sides and the interior angles ( $0 < \omega_i \leq 2\pi$ ), respectively. A finite set T of nondegenerate closed triangles K, with pairwise disjoint interiors is called *triangulation* of G if  $\bigcup K_j = \overline{G}$ 

and if the intersection of any two triangles of  $T$  is either empty or a common vertex or a common side (for the used finite element terminology we refer to CIARLET [2]). Set  $h_j = \text{diam } K_j$ ,  $h = h(T) = \max h_j$ , and  $r_j = \max \{\text{diam } B : B \subset K_j$ , B is a

circle). The triangulation T is called y-regular and y'-quasiuniform if max  $\{h_i/r_i\} \leq \gamma$ and max  $\{h_j/r_{j'}\}\leq \gamma'$   $(2\leq \gamma\leq \gamma'<\infty)$ , respectively. To any triangulation T of G and any fixed  $k \in \mathbb{N}$  we correspond the *finite element space*  $S^{(k)}(T)$  consisting of all (continuous) functions on  $\bar{G}$ , whose restrictions to the triangles  $K_i$  are polynomials of total degree at most k. Let  $Q_{T,j}^{(k)}$ ,  $j = 1, ..., M_T^{(k)}$ , denote the usual Lagrange points corresponding to T (cf. Figure 1), and introduce by the properties  $B_{T,i}^{(k)} \in S^{(k)}(T)$ ,  $B_{T,i}^{(k)}(Q_{T,i'}^{(k)}) = \delta_{j,j'}, j, j' = 1, ..., M_T^{(k)}$ , the standard basis functions of  $S^{(k)}(\tilde{T})$ . Clearly,  $M_T^{(k)} = \dim S^{(k)}(T).$ 

Let us mention that any triangulation  $T$  induces in a natural way a partition  $\partial T$ of the boundary  $\partial G$  of G and that  $\partial S^{(k)}(T) = \text{span} \{B_{T,j} | \partial G : Q^{(k)}_{T,j} \in \partial G \}$  defines the corresponding finite element space on  $\partial G$  with respect to this partition.

In the following we consider finite element approximation schemes  $\{S^{(k)}(T_i)\}$ generated by a sequence  $\{T_i\}$  of triangulations of G satisfying the properties ( $i \in \mathbb{N}_0$ )

- (a)  $S^{(k)}(T_0) \subset \cdots \subset S^{(k)}(T_i) \subset S^{(k)}(T_{i+1}) \subset \cdots$
- (b)  $T_i$  are  $\gamma'$ -quasiuniform for some fixed constant  $\gamma'$ .
- (c)  $c_1 2^{2i} \le M_{T_i}^{(k)} \equiv M_i^{(k)} \le c_2 2^{2i}$  for some constants  $c_1, c_2 > 0$ .

For instance, if  $T_0$  is any fixed initial triangulation of G, and the  $T_i$  ( $i \in \mathbb{N}$ ) are obtained from  $T_0$  by standard dyadic subdivision of the triangles (cf. Figure 2) then the corresponding finite element approximation scheme satisfies these properties. Furthermore, if (b) is fulfilled then (c) is also equivalent to

(e)' 
$$
c_1'2^{-i} \leq h(T_i) \leq c_2'2^{-i}
$$
 for some constants  $c_1'$ ,  $c_2' > 0$ .

Now, we associate to the above introduced approximation scheme some scale of function spaces. Here, and in the following, let  $0 \leq p, q \leq \infty$ , and  $L_p(G)$ ,  $l_q$  denote the usual Lebesgue spaces. Let  $s \geq 0$ .

Fig. 1. The standard Lagrange points for elements of type  $(k)$ 

Fig. 2. The triangulations  $T_i$  generated by dyadic subdivision

Definition: A function  $f \in L_p(G)$  belongs to  $A_{p,q}^s({S}_{s}^{(k)}(T_i)) \equiv A_{p,q}^{s,k}$  if there exists a representation

$$
f \equiv \sum_{i=0}^{\infty} g_i, \qquad g_i \in S^{(k)}(T_i)
$$

converging in  $L_p(G)$  where  $\check{\phantom{a}}$ 

$$
\|\{g_i\}\|_{p,q;s} \equiv \|\{2^{is} \|g_i\|_{L_p}\}\|_{l_q} < \infty.
$$

In this case, set

$$
||f||_{\mathcal{A}_{p,q}^{s,k}} \equiv \inf \left\{ ||\langle g_i \rangle||_{p,q;s} : \langle g_i \rangle \text{ satisfies (1), (2)} \right\}.
$$

Remarks: 1. This definition of  $A_{p,q}^s$ -spaces  $(s > 0)$  when applied to subspaces of trigonometric polynomials of order 2<sup>i</sup> on TN or to subspaces of entire analytic functions of most exponential type 2<sup>4</sup> on  $\mathbb{R}^N$  leads to one of the classical definitions of Besov spaces on  $\mathbb{T}^N$  or  $\mathbb{R}^N$ (cf. NIKOLSKIJ [10: 5.6]).

2. It is easy to observe that the case  $s=0$  makes sense only for  $0 < q \leq \delta = \min (p, 1)$ where  $A^{0,k}_{p,q}$  isometrically coincides with  $L_p(G)$   $(0 < p < \infty)$  and  $C(G)$   $(p = \infty)$ , respectively.

**3.** Introducing the best approximations  $E_i^{(k)}(f)_p = \inf \{||f-g||_{L_p}: g \in S^{(k)}(T_i)\}, i \in \mathbb{N}_0$ , one shows as in NIKOLSKIJ [10: 5.6] that for  $s > 0$ 

$$
||f||_{A_{p,q}^{s,k}}^{(1)} = ||\langle 2^{is}E_i^{(k)}(f)_p \rangle||_{l_q} + ||f||_{L_p} \times ||f||_{A_{p,q}^{s,k}}
$$

(equivalence up to constants depending on p, q, s, only) and that  $A_{p,q}^{s,k}$  are quasi-Banach spaces<br>for all considered parameters (Banach spaces iff  $1 \leq p, q \leq \infty$ ). For instance, setting for abbrevity  $X = A_{p,q}^{s,k}$  and  $\delta' \equiv \min(p,q,1)$  we have  $||f+g||_X^{\delta'} \le ||f||_X^{\delta'} + ||g||_X^{\delta'}$  (*f, g*  $\in X$ ) for any of the above considered equivalent quasinorms and arbitrary values of parameters.

4. Replacing  $\{S^{(k)}(T_i)\}$  by  $\{\partial S^{(k)}(T_i)\}$  we can analogously define a scale of function spaces  $\partial A_{p,q}^{s,k} = A_{p,q}^s(\overline{\{\partial S^{(k)}(T_i)\}}) \hookrightarrow L_p(\partial G)$  on the boundary of G.

The next Lemma follows from the fact that finite element approximation schemes have, in contrast to other approximation schemes, locally supported basis functions  $B_{i,j}^{(k)} \equiv B_{T_{i,j}}^{(k)}$  which are easy to handle with.

Lemma 1: Let  $\{S^{(k)}(T_i)\}\$  be a finite element approximation scheme satisfying properties (a) – (c). Then, for any

$$
g_i = \sum_{j=1}^{M_i^{(k)}} a_{i,j} B_{i,j}^{(k)} \in S_i^{(k)}(T_i), \qquad i \in \mathbb{N}_0,
$$

we have

$$
c_3: ||g_i||_{L_p} \leq ||a_i||_{L_p} \leq c_4 ||g_i||_{L_p}.
$$

 $where$ 

$$
||a_{i,j}||_{l_p} \equiv \begin{cases} \left(2^{-2i} \sum_{j=1}^{M_i^{(k)}} |a_{i,j}|^p\right)^{1/p}, & 0 < p < \\ \max\{|a_{i,j}|:j=1,\dots,M_i^{(k)}\}, & p = \infty \end{cases}
$$

(here, and in the following, the positive constants  $c_i$  ( $l=3,4,...$ ) depend on the approximation scheme (more precisely, on k, c<sub>1</sub>, c<sub>1</sub>', ( $l = 1, 2$ ) and  $\gamma'$ ) and on further parameters such as p, q, s, ..., but are independent of  $i \in \mathbb{N}_0$  and of the functions under consideration).

**Proof:** In the proofs we drop the indication of  $k$  in the notations. Observe that any restriction  $g_i|_K = \sum a_{i,j} \tilde{B}_{i,j} | K, K \in T_i$ , coincides with some polynomial of

 $(5).$ 

 $(6)$ 

 $(1)$ 

 $(2)$ 

most total degree  $k$ . Transforming  $K$  by an affine map onto a fixed reference triangle  $K_0$  one shows in a standard way, that, according to (b), (c),

$$
||g_i||_{L_p(K)} \asymp \left(\frac{2^{-2i}}{\gamma}\sum_{j:\,0_{i,j}\in K} |a_{i,j}|^p\right)^{1/p}, \quad \underset{\sigma_j:\,Q_{i,j}\in K}{\text{max}} \{|a_{i,j}|\}.
$$

(equivalence up to constants) for  $0 < p < \infty$  and  $p \doteq \infty$ , respectively. Summing up with respect to  $K \in T_i$  we obtain (6)

By Lemma 1 the following characterization of  $A_{p,q}^{s,k}$  is obvious.

Corollary 1: Let 
$$
\{S^{(k)}(T_i)\}
$$
 satisfy (a)—(c). Then

$$
||f||_{A_{p,q}^{s,k}}^{(2)} \equiv \inf \left\{ ||\langle 2^{is} ||a_{i, \cdot} ||_{l_p} \rangle ||_{l_q} \right\} \right\}
$$

where the infimum is taken with respect to all representations  $(1)$ ,  $(2)$  of the function f (cf. (5)) is an equivalent quasinorm on  $A_{p,q}^{s,k}$  for all possible choices of parameters.

Corollary 2: Let  $0 < p < p' \leq \infty$ ,  $s > 0$ ,  $0 < q \leq \infty$ , and  $s' = s - 2(1/p - 1/p')$ . Then we have the (continuous) embeddings

$$
A_{p,q}^{s,k} \hookrightarrow A_{p',q}^{s',k} \tag{8}
$$

$$
A_{p,q'}^{s,k} \hookrightarrow L_{p'} \cup (p' < \infty), \quad A_{p,1}^{s,k} \hookrightarrow C \quad (p' = \infty) \quad if \, s' = 0. \tag{9}
$$

Proof: Relation (6) immediately yields a Nikolskij type inequality

$$
\|g_i\|_{L_{p'}} \leq c_5 2^{2(1/p-1/p')i} \|g_i\|_{L_p}, \qquad 0 < p < p' \leq \infty,\tag{10}
$$

for arbitrary  $g_i \in S^{(k)}(T_i)$ ,  $i \in \mathbb{N}_0$ . Thus, (8) as well as (9) (for  $p' \leq 1$  or  $p' = \infty$ ) are obvious by definition of the spaces. Finally, the proof of (9) for  $1 < p' < \infty$  can be carried out by arguments as in  $[12:$  Theorem 7]  $\blacksquare$ 

Remarks: 5. The following more elementary embeddings

$$
A_{p,q}^{s,k} \hookrightarrow \begin{cases} A_{p,q'}^{s',k} & \text{if } 0 < p, q, q' \leq \infty, 0 < s' < s, \\ A_{p,q}^{s,k} & \text{if } 0 < p \leq \infty, 0 < q \leq q' \leq \infty, s > 0, \\ A_{p,q}^{s,k} & \text{if } 0 < p' \leq p \leq \infty, 0 < q \leq \infty, s > 0 \end{cases} \tag{11}
$$

can be combined with (8), (9) in order to obtain all possible cases of embeddings between the above defined spaces.

6. Analogous results can be stated for the spaces  $\partial A_{p,q}^{s,k}$ . For, we have to restrict all representations to the finite element spaces  $\partial S^{(k)}(T_i)$  and their basis functions  $\partial B^{(k)}_{i,j} = B^{(k)}_{i,j} |_{\partial G}$  where  $Q_i^{(k)} \in \partial G$  defined on the boundary and to make the changes in the exponents corresponding to the fact that dim  $\partial S^{(k)}(T_i) \simeq 2^i$ .

We finish this Section by stating some results on the trace to the boundary of functions belonging to  $A_{p,q}^{s,k}$ . According to [10: 6.4] and [1: 20] for our situation of a plane polygonal domain the following definition will apply. Let  $d = d_i$  be any side of G and fix some closed triangle  $\mathbf{K} \subset \overline{G}$  with d as its side (without loss of generality, suppose that  $d$  lies on the  $x_1$ -axis and  $K$  in the upper half-plane as shown by Figure 3). Then, a measurable function  $h$  defined on  $d$  is called the trace of the measurable function f defined on G if, for some  $0 < p < \infty$ , there exists a function  $f_1$  defined on  $\hat{K}$  such that  $f_1 = f$  a.e. on  $\hat{K}$ ,  $f_1 = h$  a.e. on d, the restriction of  $f_1$  to any segment.

 $(13)$ 

$$
d(x_2) = \{(x_1, x_2) : (x_1, x_2) \in \mathcal{R} \} \text{ is } L_p \text{-integrable } (x_2 \ge 0), \text{ and}
$$
  

$$
\lim_{x_1 \to 0+} \int_{a(x_1)} |f_1(x_1, x_2) - f_1(x_1, 0)|^p dx_1 = 0
$$

where  $d(x_2) = \{x_1 : (x_1, 0) \in d \text{ and } (x_1, x_2) \in d(x_2)\}\)$ . Finally h defined on  $\partial G$  is the trace of f if  $h|_d$  is the trace of f with respect to d for any side d of G. The so defined trace (if it exists) is unique and does not depend (for f belonging to some  $L_p$  space) on the particular choice of the triangles  $\hat{K}$ . It will be denoted by  $\partial f$ . Obviously, for continuous functions the trace exists and  $\partial f = f|_{\partial G}$ .

Theorem 1: Let  $0 < p, q \le \infty$ ,  $s > 1/p$ . Then any function  $f \in A_{p,q}^{s,k}$  has a trace  $\partial f \in \partial A_{p,q}^{s-1/p,k}$ , and  $||\partial f||_{A_{p,q}^{s-1/p,k}} \le c_6 ||f||_{A_{p,q}^{s,k}}$ . Moreover, the inverse statement also holds:<br>For arbitrary  $h \in \partial A_{p,q}^{s$  $\leq c_7 \left\| \partial f \right\|_{\partial A^{s-1/p,k}_{p,q}}$ 

Proof: The proof adapts the corresponding argument from the  $\mathbb{R}^N$ -case [10:<br>6.5-6]. Let  $f \in A_{p,q}^{s,k}$ ,  $s > 1/p$ , and consider any representation (1), (2). Let d and  $\hat{K}$ be as above. First we show that on the segments  $d(x_2)$  the representation  $\sum g_i$  con verges also in  $L_p(d(x_2))$  for any reasonable  $x_2 \ge 0$ . For, observe that the triangulation  $T_i$  induces on the segment  $d(x_2)$  a certain one-dimensional partition with maximal stepsize c2<sup>-i</sup>. Thus, by Lemma 1 and its one-dimensional analogue, we have

$$
||g_i||_{L_p(d(x_i))}^p \le c2^{-i} \sum_{K \in T_i: K \cap d(x_i) + \emptyset} \sum_{Q_i, j \in K} |a_{i,j}|^p \le c2^i ||g_i||_{L_p}^p
$$
\n(12)

and, thus,

$$
\sum_{i=0}^{\infty} ||g_i||_{L_p(d(x_i))}^{\delta} \leq c \sum_{i=0}^{\nu} (2^{i/p} ||g_i||_{L_p})^{\delta} \leq c ||\langle g_i \rangle||_{\delta, p, c}^{\delta}
$$

where in the last step we explored the elementary but useful inequality

$$
||2^{ib}a_i|_{i>n}||_{l_q} \leq c_0 2^{-n(s-b)} ||\{2^{is}a_i\}_{i>n}||_{l_q}
$$

which holds with a constant independent of  $n \in \mathbb{N}_0$  and the sequence  $\{a_i\}$  whenever  $-\infty < b < s < \infty$  and  $0 < q, q' \leq \infty$ . This shows the desired convergence, By (1) -48

and the above estimates it is easy to show that the limit function  $\sum g_i(x_1, x_2) =$  $f_1(x_1, x_2)$ , which is defined for any reasonable  $x_2 \ge 0$  on  $d(x_2)$  and, therefore, on  $\mathcal{K}$ , does not depend (in the sense of  $L_p(d(x_2))$ ) on the particular choice of the representation (1), (2). Furthermore, Fubini's theorem implies that  $f_1$  considered as a function on  $\hat{K}$ coincides a.e. with f. Since the functions  $g_i$  are continuous, for any  $n \in \mathbb{N}$  we can find  $x_2(n) > 0$  such that for sufficiently small  $0 < x_2 \leq x_2(n)$  we have the estimates

$$
||f_1(\cdot, x_2) - f_1(\cdot, 0)||_{L_p(\hat{d}(x_1))}^{\delta}
$$
  
\n
$$
\leq \sum_{i=0}^{\infty} ||g_i(\cdot, x_2) - g_i(\cdot, 0)||_{L_p(\hat{d}(x_1))}^{\delta} \leq 1/n + \sum_{i=n}^{\infty} (||g_i||_{L_p(d(x_i))}^{\delta} + ||g_i||_{L_p(d(0))}^{\delta}
$$
  
\n
$$
\leq 1/n + c' ||\langle 2^{i/p} ||g_i||_{L_p}^{\delta}; > n ||_{\delta}^{\delta} \leq 1/n + c2^{-(\delta - 1/p)n\delta} ||\langle g_i \rangle||_{s,p,q}^{\delta}
$$

(cf. (12), (13)). This finally proves that  $\partial f = \sum_{i=0}^{\infty} \partial g_i = \sum_{i=0}^{\infty} g_i|_{\partial G}$  (convergence in the sense of  $L_p(\partial G)$ ) defines the trace of the function  $f \in A_{p,q}^{s+k}$  if  $s > 1/p$ . Moreover, from (12) it follows that

$$
\left\| \left\langle 2^{i(s-1/p)} \left\| \partial g_i \right\|_{L_p(\partial G)} \right\rangle \right\|_{l_q} \leq c \left\| \left\langle 2^{is} \left\| g_i \right\|_{L_p} \right\rangle \right\|_{l_q}
$$

and by definition of the spaces  $A_{p,q}^{s,k}$  and  $\partial A_{p,q}^{s,k}$ , we get  $\partial f \in \partial A_{p,q}^{s-1/p,k}$  as well as the continuity of the trace operator.

In order to prove the inverse statement, let  $h \in \partial A_{p,q}^{s-1/p,k}$  be given and consider a corresponding representation

$$
h = \sum_{i=0}^{\infty} h_i, \qquad h_i = \sum_{j: Q_{i,j} \in \partial G} \bar{a}_{i,j} \; \partial B_{i,j} \in \partial S^{(k)}(T_i) \equiv S^{(k)}(\partial T_i)
$$

satisfying  $||\langle 2^{i(s-1/p)} ||h_i||_{L_p(\partial\Omega)}||_{l_q} \le c ||h||_{\partial A_{p,q}^{s-1/p;k}}$  Extending the functions  $h_i$  to the whole domain  $G$  by defining

$$
g_i = \sum_j a_{i,j} B_{i,j}, \qquad a'_{i,j} = \begin{cases} \overline{a}_{i,j} & \text{if } Q_{i,j} \in \partial G, \\ 0 & \text{otherwise} \end{cases}
$$

we have  $||g_i||_{L_p} \times 2^{-1/p} ||h_i||_{L_p(\partial G)}$ ,  $\partial g_i = h_i$ . Thus,  $f = \sum_{i=0}^{\infty} g_i$  belongs to  $A_{p,q}^{s,k}$   $(s > 1/p)$ and satisfies  $||f||_{A_{p,q}^{s,k}} \le c ||h||_{\partial A_{p,q}^{s-1/p,k}}$ . Furthermore, by our construction and the above proved first part of Theorem 1 we have  $\partial f = h$ 

Corollary 3: Let  $\Gamma \subset \partial G$  be a closed subset of the boundary which is the union of (some) segments contained in  $\partial \dot{T}_{0}$ . Then, for  $0 < p, q \le \infty$  and  $s > 1/p$  the subspaces  $A_{p,q,\Gamma}^{s,k} = \{f \in A_{p,q}^{s,k} : \partial f = 0 \text{ on } \Gamma\}$  can equivalently be defined as approximation spaces  $A_{p,q}^s(\langle S_I^{(k)}(T_i)\rangle)$  (cf. the corresponding definition above) where  $S_I^{(k)}(T_i)$  $\mathcal{L} = \{g \in S^{(k)}(T_{\vert i}) \colon g|_{\varGamma} = 0\}, \, i \in \mathbb{N}_0.$ 

Proof: Clearly, both definitions make sense and, obviously,  $A_{p,q}^s\big(\{S_{I}(k(T_i))\}\big)$  $\leftrightarrow A_{p,q,r}^{s,k}$ . In order to establish the inverse embedding, suppose that  $s > 1/p$  and  $f \in A_{p,q}^{s,k}$ ,  $\partial f = 0$  on  $\Gamma$ , and consider any representation (1), (2). Let  $s_n = \sum q_i$  and define  $\bar{s}_n \in S_r^{(k)}(T_n)$  by setting

$$
\bar{s}_n(Q_{i,j}) = \begin{cases} s_n(Q_{i,j}) & \text{if } Q_{i,j} \notin \varGamma, \\ 0 & \text{otherwise} \end{cases} (n \in \mathbb{N}_0).
$$

Since, by Lemma 1 and (13),

$$
\|\bar{s}_n - s_n\|_{L_p} \le c2^{-n/p} \|s_n\|_{L_p(\Gamma)} \le c2^{-n/p} \left(\sum_{i=n+1}^{\infty} \|g_i\|_{L_p(\Gamma)}^{\delta}\right)^{1/\delta}
$$
  

$$
\le c2^{-n/p} \| |2^{i/p} \|g_i\|_{L_p} |_{\delta} \le c2^{-sn} \| |2^{s} \|g_i\|_{L_p} |_{\delta}.
$$

we get with the notation  $\bar{g}_0 = \bar{s}_0$ ,  $\bar{g}_n = \bar{s}_n - \bar{s}_{n-1}$ ,  $n \in \mathbb{N}$ , from (1) that the representation  $f = \sum_{i=0}^{\infty} \tilde{g}_i$ ,  $\bar{g}_i \in S_f^{(k)}(T_i)$  holds in the sense of  $L_p$ . Furthermore, we can estimate (cf. (13) and set  $s_{-1} = \bar{s}_{-1} = 0$ ) as follows:

$$
\begin{aligned} \|\{\bar{g}_i\}\|_{p,q,s}^{\delta} &\leq \|\{g_i\}\|_{p,q,s}^{\delta} + \|\{s_i - \bar{s}_i\}\|_{p,q,s}^{\delta'} + \|\{s_{i-1} - \bar{s}_{i-1}\}\|_{p,q,s}^{\delta'}\\ &\leq c \left\|\left\{\hat{2}^{i(s-1/p)}\| (2^{r/p} \|g_r\|_{L_p})_{r>s} \|_{l_\delta}\right\}\right\|_{l_\delta}^{\delta'}\\ &\leq c \left\|\left\{\|\{2^{rs}\|g_r\|_{L_p}\}_{r>s} \|_{l_\delta}\right\}\right\|_{l_\delta}^{\delta'} \leq c \left\|\{g_i\}\|_{p,q,s}^{\delta'}\right| \end{aligned}
$$

Thus,  $f \in A_{p,q}^s(\{S_{\Gamma}^{(k)}(T_i)\})$  with the corresponding inequality for the quasinorms **E** 

Remarks: 7. Theorem 1 and Corollary 3 enable us to deal with finite element methods for boundary value problems. In particular, the spaces  $A_{p,q,f}^{s,k} \cong A_{p,q}^{s}(\{S_{f}(k)(T_i)\}), s > 1/p$ , are adapted to second order elliptic problems with Dirichlet conditions on the part  $\Gamma$  of the boundary.  $\sqrt{2}$ 

$$
S. For 0 < s < 1/p \text{ one can prove } A_{p,q}^s(\{S_{\Gamma}(k)(T_i)\}) \cong A_{p,q}^{s,k}.
$$

### 2.  $A_{p,q}^{s,k}$  and Besov-Sobolev spaces

In order to translate the approximation estimates given below in terms of  $A_{p,q}^{s,k}$ quasinorms into the more familiar terminology of Besov-Sobolev quasinorms we first clarify the corresponding relationships between the spaces itselves.

**For the Besov spaces on G** we use the inner description by moduli of continuity (or, what is really equivalent, by differences) as the basic definition: Let  $0 < p, q$  $\leq \infty$ ,  $s > 0$ , and  $l \in \mathbb{N}$  be given. Then a function  $f \in L_p$  belongs to the Besov space  $B_{p,q}^{s;l}$  iff

$$
||f||_{B_{p,q}^{s,l}} \equiv ||f||_{L_p} + ||\langle 2^{is}\omega_l(2^{-i},f)_p \rangle||_{l_q} < \infty
$$

where  $\omega_i(t, f)_p = \sup \{ ||\Delta_h^l f||_{L_p(G_{i,h})} : |h| \leq t \}$  is the total *l*-th order modulus of continu-<br>ity of f in  $L_p$   $(h = (h_1, h_2), |h|$  denotes its Euclidean norm,  $G_{l,h} = \{x \equiv (x_1, x_2) \in G\}$ .  $[x, x + lh] \stackrel{\sim}{\subset} G$ , and  $\Delta_h^{-l}f(x) = \sum_{i=0}^{l} {l \choose i} (-1)^{l-i} f(x + ih)$ . From the well-known saturation properties of the moduli of continuity there follows that for  $s \geq l-1$  $+1/\delta$  (exept the case  $s = l - 1 + 1/\delta$ ,  $q = \infty$ ) this definition leads to the trivial class of polynomials of total degree smaller than  $l$  on  $G$ . Informations about other possible definitions and a lot of equivalent quasinorms can be found in, e.g., BESOV, IL'IN and NIKOLSKIJ [1] or TRIEBEL [19] for  $1 \leq p, q \leq \infty$  and in TRIEBEL [18, 20] for the general case.

The Sobolev-Slobodezkij spaces  $W_p^s$ ,  $1 \leq p < \infty$ ,  $s > 0$ , are defined by

$$
W_p^m = \left\{ f \in L_p(G) : ||f||_{W_p^m} \equiv ||f||_{L_p} + \sum_{m_1+m_1=m} ||\partial^m f/\partial x_1^{m_1} \partial x_2^{m_1}||_{L_p} < \infty \right\}
$$

4 Analysis, Bd. 9, Heft 1 (1990)

for integer  $\tilde{s} = m$  and by  $W_p^s = B_{p,q}^{s,l}$  for non-integer  $s > 0$  (the integer  $l > s$  can arbitrarily be chosen). We refer again to the above cited monographs, a detailed discussion of Sobolev spaces on plane polygonal domains canhe found **in** GRISVABD [6]. Let us mention that for  $p=2$  the Sobolev-Slobodezkij spaces can equivalently he characterized as Lebesgue spaces with a somewhat different definition (for details on these  $H_p$  spaces as well as on the more general scale of Lizorkin-Triebel spaces  $F_{p,q}^{s}$  we refer to [18-20]). However, for our purposes it is sufficient to observe that the Sobolev-Slobodezkij and the Lebesgue spaces are imbedded between appropriate Besov spaces. To be precise, for  $1 \leq p < \infty$  we have **P.** Oswallom <br>  $\int \int_{\mathbb{R}}^{\mathbb{R}} f(x) dx = \int_{\mathbb{R}}^{\mathbb{R}} f(x) dx$  is the chosen). We refer again to the above cited monographs, a detailed through on of Sobolev spaces on plane polygonal domains can be found in GRISYARD is me **er**  $\hat{s} = m$  and by  $W_p^* = B_{pq}^{sl}$  for non-integer  $s > 0$  (the integer  $l > s$  can<br>y be chosen). We refer again to the above cited monographs, a detailed<br>n of Sobolev spaces on plane polygonal domains can be found in GRISV

$$

 $\leq c |h| 2^{-\ell}$  we obtain the estimate

$$
\|\Delta_h^{k+1}B_{i,j}\|_{L_p(G_{k+1,h})} = \|\Delta_h^{k+1}B_{i,j}\|_{L_p(B)} \leq c(|h| \; 2^i)^{1+1/p} \; 2^{-2i/p}
$$

which yields (17) for  $g_i = B_{i,j}$  (cf. Lemma 1). Now, let  $g_i = \sum a_{i,j} B_{i,j} \in S^{(k)}(T_i)$  be arbitrary. Since the sum  $\Delta_h^{k+1}g_i(x) = \sum_i a_{i,j} \Delta_h^{k+1}B_{i,j}(x)$ , for any  $x \in G_{k+1,h}$ , consists of at most c nonzero summands, where the constant c is independent of  $g_i$  and  $|h| \leq 2^{-i}$ , we can continue by

$$
\|\Delta_{h}^{k+1}g_{i}\|_{L_{p}(G_{k+1,h})}^{p}\leq c\sum_{j}|a_{i,j}|^{p}\|\Delta_{h}^{k+1}B_{i,j}\|_{L_{p}(G_{k+1,h})}^{p}
$$
\n
$$
\leq c(|h|2^{i})^{p+1}\|a_{i,j}\|_{L_{p}}^{p}, 0 < |h| \leq 2^{-i}.
$$

This yields (17), and Lemma 3 is established

Proof of Lemma 2: The idea is first to construct by Whitney type estimates a piecewise polynomial function of total degree k with respect to  $T_i$  which suitably approximates f in  $L_n(G)$  but does not belong to  $C(G)$ . After this, it remains to smooth this piecewise polynomial in order to get a good approximant from  $S^{(k)}(T_i)$ . The required Whitney type estimate reads as follows. Let  $0 < p \leq \infty$ ,  $k \in \mathbb{N}_0$ . For any triangle  $K \in T_i$ ,  $i \in \mathbb{N}_0$ , and  $f \in L_p(K)$  there exists a polynomial  $p_k = p_k(\cdot, f, K, p)$ of total degree  $k$  which satisfies

$$
||f - p_k||_{L_p(K)}^p \le c_{11} 2^{2i} \int \|\Delta_h^{k+1} f\|_{L_p(K_{k+1,h})}^p dh
$$

(with an obvious modification if  $p = \infty$ ). Since the term at the right-hand side of this inequality is equivalent to the  $p$ -th power of the modulus of continuity of order  $k+1$  of the function f in  $\tilde{L}_p(K)$  (with  $t=2^{-i}$ ) this is only another form of the usual Whitney type result. For a proof, which covers the general case  $0 < p \leq \infty$ , see STOROŽENKO [16, 17] and the literature cited therein (the case of triangles reduces by affine transformation and a simple extension argument to the case of squares considered in [17]). For  $1 \leq p \leq \infty$  there is a lot of further references, cf. e.g. [4, 8].

In the following we concentrate on the case  $0 < p < \infty$ , the obvious modifications in the notation for  $p = \infty$  are left to the reader. Defining, for a given function  $f \in L_p(G)$ the piecewise polynomial function  $pp_i$  (with respect to  $T_i$ ) by  $pp_i(x) = p_k(x; f, K, p)$  $(x \in K, K \in T_i)$  we obtain

$$
||f - pp_i||_{L_p}^p = \sum_{K \in T_i} ||f - p_k(\cdot; f, K, p)||_{L_p(K)}^p
$$
  
\n
$$
\leq c2^{2k} \int_{|h| \leq 2^{-l}} \sum_{K \in T_i} ||\Delta_h^{k+1}f||_{L_p(K_{k+1,h})}^p dh
$$
  
\n
$$
\leq c2^{2l} \int_{|h| \leq 2^{-l}} ||\Delta_h^{k+1}f||_{L_p(G_{k+1,h})}^p dh \leq c\omega_{k+1}(2^{-l}; f)_p^{\perp_p}, \quad i \in \mathbb{N}_0.
$$

Moreover, by the definition of the differences this yields

$$
2^{2i} \int_{\|h\| \leq 2^{-i}} \|\Delta_h^{k+1} pp_i\|_{L_p(G_{k+1,h})}^p dh
$$
  
\n
$$
\leq c2^{2i} \int_{\|h\| \leq 2^{-i}} \left( \|\Delta_h^{k+1}f\|_{L_p(G_{k+1,h})}^p + \|f - pp_i\|_{L_p}^p \right) dh
$$
  
\n
$$
\leq c2^{2i} \int_{\|h\| \leq 2^{-i}} \|\Delta_h^{k+1}f\|_{L_p(G_{k+1,h})}^p dh \leq c\omega_{k+1}(2^{-i}, f)_p^p.
$$

Thus, in order to finish the argument it suffices to construct a function  $g_i \in S^{(k)}(T_i)$ such that  $\overline{z}$ 

(18)

$$
||pp_i - g_i||_{L_p}^p \leqq c \int_{|h| \leq 2^{-t}} ||\Delta_h^{k+1} pp_i||_{L_p(G_{k+1,h})}^p dh.
$$

For, we define  $g_i$  by

$$
g_i(Q_{i,j}) = (n_{i,j})^{-1} \sum_{K \in T_i: Q_{i,j} \in K} p_k(Q_{i,j}; f, K, p), \qquad j = 1, ..., M_i,
$$

where  $n_{i,j}$  is the number of triangles  $K \in T_i$  which contain the Lagrange point  $Q_{i,j}$ . Clearly, the  $n_{i,j}$  are bounded from above by some absolute constant only depending on  $\gamma'$ . Thus (cf. the proof of Lenima 1),

$$
\|pp_i - g_i\|_{L_p}^p \leq c \sum_{K \in T_i} \left(2^{-2i} \sum_{j: Q_{i,j} \in K} |p_k(Q_{i,j}; f, K, p) - g_i(Q_{i,j})|^p\right)
$$
  

$$
\leq c \sum_{d \in D_i} 2^{-2i} \sum_{j: Q_{i,j} \in d} |p_k(Q_{i,j}; f, K_d^+, p) - p_k(Q_{i,j}, f, K_d^-, p)|^p,
$$

where  $D_i$  is the set of all sides  $d \nsubseteq \partial G$  of the triangles  $K \in T_i$ , and  $K_d^+$ ,  $K_d^+$  denote the two triangles in  $T_i$  for which  $d \in D_i$  is the common side (cf. Figure 4). Now, for any  $h \in \mathbb{R}^2$ ,  $|\bar{h}| \leq 2^{-i}$ , consider the set

$$
K_{d,h}^+ = \{x \in K_d^+ : [x, x + (k+1) h] \newline \subset K_d^+ \cup K_d^-, [x+h, x + (k+1) h] \subset K_d^- \}.
$$

Observe that there exists a measurable set  $E_d^+ \subset K_d^+$  (e.g. some closed triangle) such that mes  $H_d \ge c2^{-2i}$  where  $H_d = \{h : |h| \le 2^{-i} \text{ and } E_d^+ \subset K_{d,h}^+\}$  and, for any polynomial  $\bar{p}$  of total degree k,  $\|\bar{p}\|_{L_p(B_d^*)} \geq c \|\bar{p}\|_{L_p(K_d^*)}$ . This gives, when applied to  $\bar{p} = p_k(\cdot; f, K_d^+, p) - p_k(\cdot; f, K_d^-, p)$ , the estimates

$$
2^{-2i} \sum_{j: Q_{i,j \in d}} |p_k(Q_{i,j}; f, K_d^+, p) - p_k(Q_{i,j}; f, K_d^-, p)|^p
$$
  
\n
$$
\leq c \|\overline{p}\|_{L_p(K_d^+)}^p \leq c \|\overline{p}\|_{L_p(B_d^+)}^p \leq c \text{ (mes } H_d)^{-1} \int_{H_d} |\Delta_h^{k+1} pp_i\|_{L_p(B_d^+)}^p dh
$$
  
\n
$$
\leq c 2^{2i} \int_{|h| \leq 2^{-i}} |\Delta_h^{k+1} pp_i\|_{L_p((K_d^+ \cup K_d^-)_{k+1,h})}^p dh
$$

since, by construction of  $E_d^+ \subset K_{d,h}^+ \subset (K_d^+ \cup K_d^-)_{k+1,h}$ ,  $\Delta_h^{k+1} pp_i(x) = \overline{p}(x), x \in E_d^+$ .<br>After summing up with respect to  $d \in D_i$  we get (18)

*p,q* Theorem 5: Let  $Y = A_{p,n}^{s+1}$ <br>  $(s - s' - \alpha \ge 0)$  be given. So<br>  $||f - I_n^{(k)}f||_X \le c_{15}2^{-n(s-s'-\alpha)}||_1$ <br>
Proof: Consider any representatio<br>  $\rightarrow C(G)$ , and this representatio<br>  $I_n^{(k)}f = \sum_{i=0}^{\infty} I_n^{(k)}g_i = \sum_{i=1}^{\infty} I_n^{(k)}g_i$ <br>
Thus

Proof: Consider any representation (1), (2) of 
$$
f \in Y
$$
. Since  $s > 2/p$  we have  $Y$   
\n $C(G)$ , and this representation also converges uniformly. Therefore,  
\n
$$
I_n^{(k)}f = \sum_{i=0}^{\infty} I_n^{(k)}g_i = \sum_{i=0}^n g_i + \bar{g}_n, \qquad \bar{g}_n = I_n^{(k)} \left( \sum_{i=n+1}^{\infty} g_i \right) \in S^{(k)}(T_n).
$$
\nus, we can estimate  
\n
$$
||f - I_n^{(k)}f||_X \leq c(2^{ns'} ||\bar{g}_n||_{L_{p'}} + ||\{2^{is'} ||g_i||_{L_{p'}}\}_{i> n} ||_{l_{q'}}).
$$
\nule the second term in the right-hand side can be handled as above (cf. Theorem

**0**  Thus, we can estimate

**O** 

$$
||f - I_n^{(k)}f||_X \leq c(2^{ns'} ||\bar{g}_n||_{L_{p'}} + ||\{2^{is'} ||g_i||_{L_{p'}}\}_{i>n}||_{q'}).
$$

While the second term in the right-hand side can be handled as above (cf. Theorem 3), the considerations for the first term run as follows. For any Lagrange point  $Q_{n,j}$ , *M<sub>n</sub>*, and any  $i = n + 1, n + 2, \dots$  we fix some triangle  $K_{n,j,i} \in T$ containing  $Q_{n,j}$ . Let us observe that, for arbitrary fixed *i*, the maximal number of Lagrange points which corresponding triangles coincides is bounded by some abso-<br>lute constant. Since, obviously,  $C(G)$ , and this representation also conv<br>  $I_n^{(k)}f = \sum_{i=0}^{\infty} I_n^{(k)}g_i = \sum_{i=0}^n g_i + \bar{g}_n$ ,<br>
Thus, we can estimate<br>  $||f - I_n^{(k)}f||_X \le c(2^{ns'} ||\bar{g}_n||_{L_{p'}} + ||$ <br>
While the second term in the right-hand s<br>
3), the consideration urb<br>ngl<br>. Thus,  $\nu$ <br>
While t<br>
3), the<br>  $j = 1,$ <br>
contain<br>
Lagram<br>
lute cor  $g(Q_{n,j})$ . Let us observe that, for arbitrary fixed *i*, the maxima<br>points which corresponding triangles coincides is bounded by<br>tant. Since, obviously,<br> $|g_i(Q_{n,j})| \le c ||g_i||_{L_{\infty}(K_{n,j;i})} \le c 2^{2i/p} ||g_i||_{L_p(K_{n,j;i})}$ 

$$
|g_i(Q_{n,j})| \le c ||g_i||_{L_{\infty}(K_{n,j;i})} \le c 2^{2i/p} ||g_i||_{L_p(K_{n,j;i})}
$$

 

we obtain

$$
2^{ns'} \|\tilde{g}_n\|_{L_{p'}} \leq c2^{n(s'+\alpha)} \|\tilde{g}_n\|_{L_p}
$$
  
\n
$$
\leq c2^{n(s'+\alpha-2/p)} \left(\sum_{j} \left(\sum_{i=n+1}^{\infty} |g_i(Q_{n,j})|\right)^p\right)^{1/p}
$$
  
\n
$$
\leq c2^{n(s'+\alpha-2/p)} \left(\sum_{j} \|\left\{2^{2ilp} \|g_i\|_{L_p(K_{n,j,i})}\right\}_{i>n} \|\tilde{l}_i\right)^{1/p}
$$
  
\n
$$
\leq c2^{-n(\bar{s}-s'-\alpha)} \left(\sum_{i=n+1}^{\infty} 2^{i\bar{s}p} \left(\sum_{j} \|g_i\|_{L_p(K_{n,j,i})}^p\right)\right)^{1/p}
$$
  
\n
$$
\leq c2^{-n(s-s'-\alpha)} \|\langle 2^{is} \|g_i\|_{L_p}\}_{i>n} \|\|_{q}
$$

(with  $2/p < \bar{s} < s$ , and obvious modifications if  $p = \infty$ ). This yields the desired estimate for the first term 1

Clearly, by Theorem 2 and Corollary 4, the results formulated in the Theorems of this section can now be translated into estimates for Besov-Sobolev quasinorms. For instance, this yields

Corollary 5: Let  $k \in \mathbb{N}$ ,  $1 \leq p, p' < \infty$  and  $0 \leq s' < s - \alpha$  be given where  $\tilde{s} \leq k+1$ ,  $s' < 1+1/p$ . Then, for any function  $f \in W_p^{\sigma} \hookrightarrow W_{p'}^{\sigma'}$  we have

$$
E_n^{(k)}(f)_{W_n^{s'}} \leqq c_{16}h(T_n)^{s-s'-s} ||f||_{W_p^s}, \qquad n \in \mathbb{N}_0,
$$

and in the case  $s > 2/p$  also

$$
||f - I_n^{(k)}f||_{W_{n'}^{s'}} \leq c_{17}h(T_n)^{s-s'-\alpha}||f||_{W_{n'}^{s}}, \qquad n \in \mathbb{N}_0.
$$

Proof: By Corollary 4 we have  $E_n^{(k)}(f)_{w_2^{(k)}} \le c E_n^{(k)}(f)_X$ ,  $||f||_Y \le c ||f||_{W_p}$ , where

$$
X = \begin{cases} L_{p'} \cong A^{0,k}_{p',1}, s' = 0, \\ A^{s',k}_{p',\min(p',2)}, s' > 0, \end{cases} \qquad Y = \begin{cases} A^{s,k}_{p,\max(p,2)}, & s < k+1, \\ A^{k+1,k}_{p,\infty}, & s = k+1. \end{cases}
$$

Since  $s' < s - \alpha$  has been supposed, the assumptions of Theorem 3 and 5 are fulfilled which yields the corollary (recall that  $h(T_n) \times 2^{-n}$ )

The formulation of further corollaries, e.g. for Besov quasinorms or concerning the inverse inequalities (Theorem 4), is left to the reader.

Remarks: 14. Analogous statements can be given for the rate of approximation for functions defined on the boundary  $\partial G$  when using the spaces  $\partial A^{s,k}_{p,q}$ , or for functions belonging to  $A_{p,q;\Gamma}^{s,k}$ ,  $s > 1/p$  (cf. Corollary 3).

15. Corollary 5 is contained in [2: Theorems 3.1.4.6] for more general partitions but with some additional restrictions on s, s'. The results for Besov spaces (although they are closely related to those for Sobolev norms) as well as the approach via approximation spaces as introduced above seem to be new. The motivation for including the nonclassical case  $p < 1$ comes from applications to the approximation of functions with singularities (see the following sections). $\degree$ 

It should also be mentioned that the indicated ranges of parameters as well as the exponent  $(s - s' - \alpha)$  occuring in the estimates cannot be improved. However, improvements of the asymptotic rate of approximation are possible if we approximate by finite element functions with variable triangulations consisting of a given number of triangles (instead of approximating with respect to a given sequence of triangulations). The use of the triangulation as additionul degrees of freedom leads to a certain nonlinear approximation problem which will be discussed in the next section.

## **4. Nonlinear finite element approximation (variable triangulations)**

*/*<br>*/*<br>*<i>/*<br>*<i>/***</del>** One of the strategies for improving the accuracy of finite element approximations is to make a proper-choice of the underlying triangulation, e.g. by adapting the triangulation to the singularities of the functions to be approximated, without essen-• tially increasing the dimension of the corresponding finite element space. From a theoretical point of view, this question leads to a certain nonlinear approximation problem, i.e. to estimates for the nonlinear best approximations **S**<br>S<br>S **- e(k)(/)** <sup>=</sup>inf inf J/ — gJJx • - -' - - (20) **<sup>S</sup> .**  s so miproving the accuration<br>choice of the underlying<br>ingularities of the funct<br>*T* view, this question lead<br>imates for the nonlinear<br>inf  $\inf_{T|\leq n} \inf_{g \in S^{(k)}(T)}$ <br>the number of triangles in 56 P. $$
\n
$$
\le c(2^{2r} + c(f)^{-p} \ 2^{(2+r)} \ ||2^{i(s - \epsilon/p)} ||g_i||_{L_p}\|_{\epsilon>r} ||l_p^p|)
$$
\n
$$
\le c2^{2r}(1 + c(f)^{-p} \ ||2^{i\epsilon} ||g_i||_{L_p}\|_{\epsilon>r} ||l_p^p| \le c2^{2r}
$$
\n
$$
= ||2^{i\epsilon} ||g_i||_{L_p}\|_{\epsilon>r} ||l_q^p| \text{ and using once more (13).}
$$

by defining  $c(f) \equiv ||{2^{is} ||g_i||_{L_p}}_{i> r}||_{l_q}^p$  and using once more (13).

On the other hand, if we denote

$$
g_i^{(r)} \equiv \sum_{j=1}^{M_i} a_{i,j}^{(r)} B_{i,j} \text{ and } f^{(r)} = \sum_{i=0}^{\infty} g_i^{(r)} (\in S_{n_r}^{(k)}),
$$
  
then, for  $p' < \infty$ , we can estimate as follows:

$$
f)_{X} \leq ||f - f^{(r)}||_{X} \leq ||\{2^{is'}||g_{i} - g_{i}^{(r)}||_{L_{p}}\}||_{l_{q'}}
$$
  
\n
$$
\leq c \left\| \left\{ 2^{i(s'-2/p')} \left( \sum_{j: [a_{i,j} \leq 2^{p'}i + \beta r_{\ell(j)}]} |a_{i,j}|^{p'} \right) \right\}_{i > r} ||_{l_{q'}} \right\}
$$
  
\n
$$
\leq c (f)^{1-p/p'} 2^{\beta(1-p/p')r}
$$
  
\n
$$
\leq \left\| \left\{ 2^{i(s'-2/p'+\beta'(1-p/p'))} \left( \sum_{j=1}^{M_{t}} |a_{i,j}|^{p} \right) \right\}_{i > r} ||_{q'} \right\}
$$
  
\n
$$
\leq c(f)^{1-p/p'} 2^{\beta(1-p/p')r}
$$
  
\n
$$
\times ||\{2^{i(s'+\beta'(1-p/p'))p'/p} ||g_{i}||_{L_{p}}\}_{i > r} ||_{l_{q'}p'}
$$
  
\n
$$
\leq c(f)^{1-p/p'} 2^{\beta(1-p/p')r}
$$
  
\n
$$
\times 2^{-r(s-(\beta'(1-p/p'))p'/p)p/p'} ||\{2^{is}||g_{i}||_{L_{p}}\}_{i > r} ||_{l_{q'}p'}
$$
  
\n
$$
\leq c(f) 2^{-(s-s')r} \leq c2^{-(s-s')r} ||[g_{i}||_{p,q;s}
$$

where the use of (13) in the above estimates requires a choice of  $\varepsilon$  satisfying  $0 < \varepsilon$  $\langle (s - s' - s)/(1/p - 1/p')$  which is possible by the assumptions. The modifications for the case  $p' = \infty$  are obvious. It remains to take the infimum with respect to all considered representations of  $f \in Y$ 

Remarks: 16. The above construction also guarantees a certain smoothness of the approximants:  $||f^{(r)}||_Y \leq c_{18} ||f||_Y, r \in \mathbb{N}_0$ .

17. The construction of the approximants really depends on  $f$ ,  $s$ ,  $p$ , and  $\varepsilon$ , only. Thus, we get simultaneous approximation estimates for a lot of quasinorms  $\|\cdot\|_X$ , e.g. if  $0 < p, p', q, q' \leq \infty$ , and  $0 \leq s' \leq s_0'$  where  $s_0' < s - \alpha$  is a fixed real number. The above result partly holds for  $s' = s - \alpha$ , too.

Now, let us show how the considerations can be slightly modified in order to estimate the quantities (20) and to get some further information on the underlying triangulations. The idea is to prove that for the function  $f^{(r)}$  introduced in the proof of Theorem 6 there exists a certain triangulation  $T^{(r)}$  of G into at most  $c2^{2r}$  triangles such that  $f^{(r)} \in S^{(k)}(T^{(r)})$ ,  $r \in \mathbb{N}_0$ . Furthermore, it can be shown that the  $T^{(r)}$  are y-regular for some  $\gamma \leq c\gamma'$ .

Theorem 7: Let  $0 < p, p', q, q' \le \infty$  and  $0 \le s' < s - \alpha$  where  $\alpha = \max\{0, 2(1/p - 1/p')\}$ . Denote  $X = A_{p',q'}^{s',k}$ ,  $Y = A_{p,q}^{s,k}$ , and consider any  $f \in Y$  ( $\hookrightarrow X$ ). Then, for  $n \ge n_0 \equiv M_0^{(k)}$ , there exist triangulations  $T_n^*$  and  $S^{(k)}(T_n^*)$  satisfying the following properties:

(i)  $T_n^*$  consists of at most *n* triangles and is y-regular for some constant  $\gamma \leq c_{19} \gamma'$ . Furthermore,  $h(T_n^*) \times n^{-1/2}$ .

(ii) 
$$
e_n^{(k)}(f)_{X'} \le ||f - f_n||_X \le c_{20} n^{-(s-s')/2} ||f||_Y.
$$

(iii) 
$$
||f_n||_Y \leq c_{21} ||f||_Y
$$
.

Proof: We consider the functions  $f^{(r)}$  defined in the proof Theorem 6. For the construction of the corresponding triangulations  $T^{(r)}$  we introduce the following

# P: OSWALD

terminology: Let  $K \in T_i$  for some  $i \in \mathbb{N}_0$  and put  $T_{-i} = T_0$ .  $\circ$ 

Now we construct in a canonical way a new set of closed triangles  $\bar{\theta}^{(r)} \supset \Theta^{(r)}$ satisfying the following properties:

1. If  $K \in \overline{\Theta}^{(r)}$ , then for some  $i = i(K) \geq r$  we have  $K \in \overline{T}_i$ .

*)*, and some side  $d$  of  $K$  is contained in some side  $d'$  of  $K'$  (i.e.  $K$  and From the following properties:<br> **A.** If  $K \in \overline{\Theta}^{(r)}$ , then for some  $i = i(K) \ge r$  we have  $K \in$ <br> **2.** If  $K, K' \in \overline{\Theta}^{(r)}$ , and some side *d* of  $K$  is contained in sor<br> *K'* are neighbors or coincide), then  $0 \le i(K) - i(K') \$ 

and construct by induction  $\Theta_{i_1-1}^{(r)}, \ldots, \Theta_{r}^{(r)}$ . The induction step consists in the following procedure: Let  $\Theta_l^{(r)}$  be already defined for some  $l = i_0, \ldots, r + 1$ . First extend For this reason, define  $i_0 \ge r$  by the requirements  $T_i \cap \Theta^{(r)} = \emptyset$  for  $i > i_0$ , and  $T_i \cap \Theta^{(r)} = \emptyset$ . If  $i_0 = r$ , then  $\Theta^{(r)} = \overline{\Theta}^{(r)} = T_r' = T^{(r)}$ . If  $i_0 > r$ , then put  $\Theta^{(r)} = \Theta^{(r)}$  and construct by induction  $\Theta^{$  $\Theta_l^{(r)}$  by adding all those triangles  $K' \in T_l \setminus \Theta_l^{(r)}$  for which there exists some triangle  $K \in T_l \cap \Theta_l^{(r)}$  possessing a common side with *K* and satisfying  $P(K) \subset \Theta_l^{(r)}$ .<br>This extended set of triangles will be deno 3. If  $K \in \overline{\Theta}^{(r)}$ , then  $P(P^{-1}(K)) \subset \overline{\Theta}^{(r)}$ , too.<br>
For this reason, define  $i_0 \ge r$  by the requirements  $T_i \cap \Theta^{(r)} = \emptyset$  if  $i_0 \in \Theta^{(r)} + \emptyset$ . If  $i_0 = r$ , then  $\Theta^{(r)} = \overline{\Theta}^{(r)} = T_r = T^{(r)}$ . If  $i_0 > r$ , then and cons

$$
\Theta_{l-1}^{(r)} = \overline{\Theta}_l^{(r)} \cup \Big(\cup \big((P^{-1}(K) \cup P(P^{-1}(K))\big) : K \in \Theta_l^{(r)} \cap T_l\Big)\Big).
$$

It can easily be observed that  $\bar{\Theta}^{(r)} \equiv \Theta_r^{(r)}$  satisfies the properties 1-3 from above (Figure 5 illustrates the construction for a fictive set  $\Theta^{(r)}$  with  $i_0 = 3, r = 0$  where G is a square and  $T_0$  consists of two triangles as indicated).

Furthermore, if  $n_i^{(r)}$  and  $\bar{n}_i^{(r)}$  denotes the number of triangles belonging to  $\Theta^{(r)}$  $f \circ T_i$  and  $\overline{\Theta}^{(r)} \circ T_i$  ( $i = r, r + 1, ..., i_0$ ), respectively, then according to the above construction and to the estimates of  $n_r$  in the proof of Theorem 7 we get for the num-.

Fig. 5. The construction of  $T^{(r)}$ 

ber  $\bar{n}_r$  of triangles in  $\bar{\theta}^{(r)}$  $\frac{1}{2}$  ber  $\overline{n}_r$  of transfer  $\overline{n}_r$

$$
\nNow, in order to define  $T^{(r)}$ , we consider all those triangles  $K' \in \overline{\Theta}^{(r)}$  which do not contain triangles  $K'' \in \overline{\Theta}^{(r)}$  with  $i(K') > i(K')$  but possess a neighboring triangle  $K$  with  $i(K) > i(K')$ , i.e., there exists some  $K \in \overline{\Theta}^{(r)}$  such that  $K' \cap K' = d$  is a side.

 $\mathcal{F}^{\mathcal{A}}_{\mathcal{A}}$  . The set of  $\mathcal{F}^{\mathcal{A}}_{\mathcal{A}}$  is the set of  $\mathcal{F}^{\mathcal{A}}_{\mathcal{A}}$  . In the set of  $\mathcal{F}^{\mathcal{A}}_{\mathcal{A}}$  $\mathbf{v} = \begin{bmatrix} \mathbf{v}_1 & \mathbf{v}_2 & \mathbf{v}_3 & \mathbf{v}_4 & \mathbf{v}_5 & \mathbf{v}_6 & \mathbf{v}_7 & \mathbf{v}_8 & \mathbf{v}_7 & \mathbf{v}_8 & \mathbf{v}_7 & \mathbf{v}_8 & \mathbf{v}_7 & \mathbf{v}_8 & \mathbf{v}_8 & \mathbf{v}_9 & \mathbf{v}_9$ 

Now, in order to define  $T^{(r)}$ , we consider all those triangles  $K' \in \overline{\Theta}^{(r)}$  which do not contain triangles  $K'' \in \overline{\Theta}^{(r)}$  with  $i(K') > i(K')$  but possess a neighboring triangle  $K$  with  $i(K) > i(K')$ , i.e. there exists som **EXECUTE:**  $\frac{1}{2}$ ,  $\frac{1}{2}$ , K with  $i(K) > i(K')$ , i.e. there exists some  $K \in \overline{\Theta^{(r)}}$  such that  $K' \cap K = d$  is a side of  $K$  and  $i(K) = i(K') + 1$  (cf. property 2). Such triangles  $K'$  will be subdivided into 2 or 3 or 4 new triangles (which will be added to Now, in order to define  $T^{(r)}$ , we consider all those triangles  $K' \in \overline{\Theta}^{(r)}$  which do not<br>contain triangles  $K'' \in \overline{\Theta}^{(r)}$  with  $i(K'') > i(K')$  but possess a neighboring triangle<br> $K$  with  $i(K) > i(K')$ , i.e. there exists so ing from  $\Theta^{(r)}$  all triangles which are further subdivided, we obtain a triangulation (cf. Figure 5). This triangulation is the 'required'  $T^{(r)}$ . Obviously,  $f^{(r)} \in S^{(k)}(T^{(r)}),$ 2 or 3 or 4 new triangles (which will be added to  $\bar{\Theta}^{(r)}$ ) in such a way that, after delet-<br>ing from  $\bar{\Theta}^{(r)}$  all triangles which are further subdivided, we obtain a triangulation<br>(cf. Figure 5). This triangulation This proves (i), the statements (ii) and (iii) are contained in Theorem  $6'(cf.$  Remark 16, too)  $\blacksquare$ Frameles in  $\overline{\Theta}^{(r)}$ <br>  $\overline{n}_r = \sum_{i=1}^{i_1} \overline{n}_i^{(r)} \leq c \left( 2^{(r)} + \sum_{i=i+1}^{i_2} \sum_{j=1}^{i_3} n_j^{(r)} \right)$ <br>  $\overline{n}_r = \sum_{i=1}^{i_4} \overline{n}_i^{(r)} \leq c \left( 2^{(r)} + \sum_{i=i+1}^{i_5} \sum_{j=1}^{i_6} n_j^{(r)} \right)$ <br>  $\leq c \left( 2^{2r} \left( 1 + c(f)^{-p} \right) \left[$ and  $T^{(r)}$  consists of at most  $4\overline{n}_r$  (≤  $c2^{2r}$ ) triangles and is  $\gamma$ -regular for some  $\gamma \le c\gamma'$ .<br>This proves (i), the statements (ii) and (iii) are contained in Theorem 6 (cf. Remark<br>16, too) ■<br>Remarks: 18. For

Remarks: 18. For  $0 < p < p' \leq \infty$ , the asymptotic estimate (ii) improves the estimate functions with respect to the quasinorm of X, a proper choice of the triangulation gives an improvement of the asymptotic rate of approximation by the factor  $n^{-\alpha}$  in comparision with the corresponding approximation on a quasiuniform, triangulation with the same number of triangles (as above,  $\alpha = \max(0, 2(1/p - 1/p'))$ ). Thus, in applications to approximation estitriangles (as above,  $\alpha = \max(0, 2(1/p - 1/p'))$ ). Thus, in applications to approximation estimates in  $X = A_{p,q}^{s/k}$ , we should be interested in verifying  $f \in Y = A_{p,q}^{s/k}$  where *s* is as large as possible. For this reason, p, can be taken arbitrarily small but satisfying the imbedding  $Y \hookrightarrow X$ . Such a situation is typical for functions with singularities. For instance, let *x* ks: 18. For 0<br> *y* with respect to<br>

Such a situation is typical for functions with singularities. For instance, let

\n
$$
f = f_0 + \sum_{j=1}^{N} \mu_j \left( \sum_{l=1}^{N_j} r_j^{a_{j+1}} |\ln(r_j)|^{\beta_{j+l}} \psi_{j,l}(\varphi_j) \right)
$$
\nwhere  $f_0 \in W_{p_0}^{k+1}$ ;  $r_j$ ,  $\varphi_j$  are local polar coordinates (cf. Figure 6) and  $\mu_j \in C_0^{\infty}([0, \infty))$  cut-off functions with respect to the corner  $P_j$ ,  $j = 1, ..., N$ . Furthermore,  $\psi_{j,l} \in C^{\infty}([0, \omega_j])$ , and  $\alpha_{j,l}$ .

**Properties in**  $X = A_p^{s'}$ **,**  $k_r$ , we should be interested in verifying  $f \in Y = A_p^{s'}$ , where s is as large as<br>
possible. For this reason,  $p$  can be taken arbitrarily small but satisfying the imbedding  $Y \hookrightarrow X$ .<br>
Such a situa where  $f_0 \in W_{p_0}^{k+1}$ ;  $r_j$ ,  $\varphi_j$  are local polar coordinates (cf. Figure 6) as<br>functions with respect to the corner  $P_j$ ,  $j = 1, ..., N$ . Furthermore<br> $\beta_{j,l} \ge 0$  are real constants. It can easily be checked that for  $p \$  $\beta_{j,l} \geq 0$  are real constants. It can easily be checked that for  $p \leq p_0$  satisfying the inequality  $\frac{1}{2}$  $f = f_0 + \sum_{j=1}^N \mu_j \left( \sum_{l=1}^N r_j^{s_{j+l}} |\ln(r_j)|^{\beta_{j+l}} \psi_{j,l}(\varphi_j) \right)$  (22)<br>
where  $f_0 \in W_{p_0}^{k+1}$ ;  $r_j$ ,  $\varphi_j$  are local polar coordinates (cf. Figure 6) and  $\mu_j \in C_0^{\infty}([0, \infty))$  cut-off<br>
functions with respect to the when choosing the parameter p, we should satisfy the inequalities  $k + 1 - s' + 2/p' > 2/p$  $> k + 1 - \alpha$  and  $p \leq p_0$  which is possible iff min  $(\alpha, k + 1 - 2/p_0) > s' - 2/p'$ . This result covers, for instance, the particular but important case  $0 < p \leq p' = q' = 2$ ,  $s' = 1$  which will

*I*

be applied with some modification in Section 5 below:

$$
e_n^{(k)}(f)_{H^1} \leq cn^{-k/2} ||f||_Y = O(n^{-k/2}), \qquad n \to \infty.
$$
 (23)

Thus, by defining appropriate triangulations, it is possible to approximate the functions (22) which are not sufficiently smooth in the  $L_2$  sense with asymptotically high accurracy in the energy norm (as well as in other norms based on  $L_2$  smoothness).

19. If one needs results for functions which vanish at part of the boundary (e.g. for  $\tilde{H}^s$ ) the analogous theory for  $A_{p,q,\Gamma}^{s,k}$  can be applied without substantial changes. To this end, use the description of these spaces given in Corollary 3, cf. also Remark 8. Some special cases have been already discussed without detailed proofs in [5].

### 5. Finite element error estimates for elliptic problems in polygonal domains

For simplicity, let us consider the Poisson equation.

$$
-\Delta u = f \quad \text{in } G,
$$
  
  $u \leq 0 \quad \text{on } \Gamma \subset \partial G; \quad \partial u/\partial n = 0 \quad \text{on } \partial G \setminus \Gamma$  (24)

with homogeneous Dirichlet and Neumann boundary conditions on  $\Gamma$  and  $\partial G \setminus \Gamma$ respectively, where  $\Gamma$  is assumed to be the union of some sides  $d_i$  of the polygonal domain G (hence, the value  $\omega_i = \pi$  is allowed, cf. Figure 7). Suppose that  $\Gamma + \emptyset$ . The model problem (24) possesses a unique weak solution  $u = u_I \in H_I^1 \equiv \{v \in H\}$ :  $\partial v = 0$  on  $T$  under rather general assumptions on f (say,  $f \in L_p$  for some  $p > 1$ ), i.e. a solution of the problem:

Find  $u \in H_{\Gamma}^1$  such that  $a(u, v) = (f, v) \forall v \in H_{\Gamma}^1$ where

$$
u(u, v) = \int\limits_{G} \left( \frac{\partial u}{\partial x_1} \frac{\partial v}{\partial x_1} + \frac{\partial u}{\partial x_2} \frac{\partial v}{\partial x_2} \right) dx, \qquad (f, v) = \int\limits_{G} f v \, dx.
$$

For a given triangulation  $T$  of  $G$ , denote by

$$
S_{\Gamma}^{(k)}(T) \equiv S^{(k)}(T) \cap H_{\Gamma}^{1} = \{v_{T} \in S^{(k)}(T) : v_{T}|_{T} = 0\}
$$

the conforming finite element space corresponding to (25). Then, the finite element solution of the problem  $(25)$  is defined by:

Find 
$$
u_T \in S_{\Gamma}^{(k)}(T)
$$
 such that  $a(u_T, v_T) = (f, v_T) \forall v_T \in S_{\Gamma}^{(k)}(T)$ .  $(26)$

where  $u_g$  d Thus, the inequalities  $(27)$ ,  $(28)$  reduce the problem of error estimating in the energy and  $L_2$  norm to the study of certain best approximations. First we discuss the  $\alpha$  application of the standard results of Section 3. Consider  $T = T_i$ ,  $i \in \mathbb{N}_0$  (for simplicity, suppose that each corner point P<sub>i</sub> of G already coincides with the vertex of some triangle belonging to the initial triangulation  $T_0$ , cf. Figure 7). According to  $(27)$ ,  $(28)$ , the relevant best approximations to be estimated are Let  $\mathbf{H}(\mathbf{w}) = \mathbf{H}(\mathbf{w}) = \mathbf{H}(\math$ 

$$
E_i(w)_{A_{2,2,\Gamma}^{1,k}} = \inf \left\{ ||w - v_i||_{A_{2,2}^{1,k}} : v_i \in S_{\Gamma}^{(k)}(T_i) \right\}.
$$
 (29)

where  $w = u = u_f$  and  $w = u_0$  (for  $g \in L_2$ ) belongs to  $H_I^1 \cong A_{2,2,\Gamma}^{1,k}$ . Thus, the results of Section 3 apply and lead to  $Q(h(T_i)^r)$  error estimates for  $i \to \infty$  with some  $\tau > 0$ if we can prove regularity properties of the solutions of (25). A detailed investigation of the regularity theory for elliptic problems in plane polygonal domains is given in GRISVARD  $[6]$ . For our purposes, we quote from  $[6]$ : Theorem 5.1.3.5] the following assertion: inf  $\{||w - v_i||_{A_{2,2}^{1,k}} : v_i \in S_f^{(k)}(T_i)\}$  (29)<br>
d  $w = u_0$  (for  $g \in L_2$ ) belongs to  $H_r^1 \cong A_{2,2,r}^{1,k}$ . Thus, the results<br>

$$

where, as above,  $r_i$ ,  $\varphi_i$  denote the local polar coordinates and  $\mu_i$  the cut-off functions corresponding to  $P_j$ ,  $j'=1, ..., N$ .

This result shows that, in general, the solution *u* of (25) belongs to  $W_p^s$  only for small s. According to [6: Theorem 1.4.5.3] the precise restrictions are  $s < s_0 \equiv \min$  $(2/p + \lambda_i)$  and  $s \leq m + 2$ . Further results of this type for elliptic boundary value problems are contained in KUFNER and SANDIG  $[9]$ .  $-\omega_j \sin t$  if  $\lambda_{j,l} \in \mathbb{Z}$ ,<br>polar coordinates and  $\mu_j$  the cut-off functions<br>he solution  $u$  of (25) belongs to  $W_p^s$  only for<br>5.3] the precise restrictions are  $s < s_0 \equiv \min_j$ <br>ssults of this type for elliptic boundary v

In order to illustrate this situation, we shall consider a L-shaped domain and mixed boundary conditions as indicated in Figure 8  $(I = \partial G \setminus d_1)$ . For this example we have  $\lambda_{1,1} = 1/3$ ,  $\lambda_{j,1} = 2, j = 2, ..., 5,$  and  $\lambda_{6,1} = 1$ . Checking the assumptions to be fulfilled for the representa-

Fig. 8. Example of an L-shaped domain with boundary conditions

tion (31), in the case  $m = 0$  (i.e. for  $f \in L_p$ ,  $1 < p \le 2$ ) we obtain

$$
u = u_{\text{reg}} + \begin{cases} c_{1,1}S_{1,1}, & 6/5 < p < 2, \\ 0, & 1 < p < 6/5. \end{cases}
$$

This immediately yields  $u \in W_p^2$  for  $1 < p < 6/5$  and  $u \in W_p^s$  for  $s < 2/p + 1/3$  and  $6/5 \leq p$  $\leq$  2. Now, by the results of the preceding sections we can estimate the quantities (29). Together with (27), this yields

$$
-u_{T_{i}}||_{H^{1}} \leq cE_{i}(u)_{A_{2,2,\Gamma}^{1,k}}
$$
\n
$$
\leq c\left\{\n\begin{aligned}\n2^{-(i(2-1-2(1/p-1/2))}||u||_{W_{p}}, & 1 < p < 6/5, \\
2^{-(s-1-2(1/p-1/2))}||u||_{W_{p}}, & s < 2/p + 1/3, 6/5 \leq p \leq 2, \\
& \leq c||f||_{L_{p}}\left\{\n\begin{aligned}\n2^{-2i}(|J^{-1/p}) & \leq c||f||_{L_{p}}\left\{\n\begin{aligned}\nh(T_{i})^{2(1-1/p)}, & 1 < p < 6/5, \\
h(T_{i})^{1/3-\epsilon}, & 6/5 ≤ p \leq 2.\n\end{aligned}\n\end{aligned}\n\right.\n\end{aligned}\n\right.
$$

Analogous considerations show that for  $m \in \mathbb{N}$  we generally have

$$
||u - u_{T_i}||_{H^1} \leqq c2^{-i(1/3 - \epsilon)} ||f||_{W_p^m} \leqq ch(T_i)^{1/3 - \epsilon} ||f||_{W_p^m}
$$

where  $\varepsilon > 0$  is arbitrary,  $i \in \mathbb{N}_0$ . Thus, due to the corner singularities (here mainly to that at the corner  $P_1$ ), the asymptotic error estimate in the energy norm is far from the theoretical possible  $O(h(T_i)^l)$  estimate where  $l = \min(k, m + 1)$ . This effect is also present in practical computations based on the standard conforming finite element method with uniform or quasi--uniform triangulations (such as the above considered triangulations  $T_i$ ,  $i \in \mathbb{N}_0$ ).

There are several possibilities for avoiding this situation. For instance, special elements or special trial functions which model the singularities at the corner points can be included into the finite element space. Another strategy is based on refinements of the underlying triangulations near the corners, A brief discussion of these techniques is contained in [6: 8.4], see also  $[21]$ .

We show that the results of Section 4 (especially the variant of Theorem 7 for the spaces  $A_{p,q,r}^{s,k}$ , and Remark 18) yield the following, in some sense optimal, asymptotic error estimate.

Theorem 8: Let  $f \in W_p^m$  for some  $m \in \mathbb{N}_0$  and  $1 < p \leq 2$ . Then, for  $n \geq n_0$ , there exist triangulations  $T_n^*$  satisfying property (i) from Theorem 8 such that for the solutions u and  $u_n \equiv u_{T_n^*}$  of (25) and (26) the estimate

$$
||u - u_n||_H \leq c_{22} n^{-1/2} ||f||_{W_m} = c'_{22} h(T_n^*)^l ||f||_{W_m}
$$
 (32)

holds where  $l = \min(m + 1, k)$ .

We outline the proof of this assertion. Without loss of generality, let  $m + 1 \leq k$ , and  $1 < p \leq 2$  satisfy (30) (if the latter condition is not fulfilled, then consider some smaller  $p - \varepsilon < \overline{p} < p$  satisfying (30) and observe that the argument given below

leads to the required estimates if  $\varepsilon > 0$  is sufficiently small). According to (31), we see that the solution  $u$  of (25) has exactly the form of the functions (22) considered in Remark 18, where  $p_0 = p$  and  $\bar{\alpha} = \min \lambda_{j,1} \ge \min \frac{\pi}{2\omega_j} \ge \frac{1}{4}$ . Now, choosing  $p^*$  such that  $2/(m + 2) < p^* < 2/(m + 7/4)$  and  $p^* \le p$  we guarantee, on the one hand, the inclusion

$$
\epsilon B^{m+2,k+1}_{p^*,\infty,r} \equiv \{v \in B^{m+2,k+1}_{p^*,\infty}; \partial v|_{r} = 0\} \hookrightarrow Y = A^{m+2,k+1}_{p^*,\infty,r}
$$

where  $||u||_Y \le c ||f||_{W_p^m}$  and, on the other hand, that with this Y and  $X = A_{2,2,\Gamma}^{1,k+1}$  an analogon of Theorem 7 holds (observe that  $(m + 2) - 1 > 2(1/p - 1/2)$  by construction). This implies the existence of triangulations  $T_n^*$  satisfying property (i) from Theorem 8 and

$$
||u - u_n||_{H^1} \leq c \inf_{r} \{ ||u - v_n||_X : v_n \in S_r^{(k)}(T_n^*) \}
$$
  
 
$$
\leq c n^{-(m+2)-1)/2} ||u||_Y \leq c n^{-(m+1)/2} ||f||_{W_p^m}, \qquad n \geq n_0.
$$

This actually proves (32)  $\blacksquare$ 

Remark: 20. By some additional arguments one can also show that under the assumptions of Theorem 8 we have the  $L_2$  error estimate

$$
||u - u_n||_{L_2} \leq c_{23} n^{-(l+1)/2} ||f||_{W_n^m} \leq c_{23}^{\prime} h(T_n^*)^{l+1} ||f||_{W_n^m}.
$$

It should be mentioned that (32), (33) are known for  $p = 2$  where the corresponding triangulations can be determined explicitly (cf.  $[11, 14]$ , or  $[6: 8.4]$ ).

### **6. Further comments**

The approach presented in the preceeding sections could serve, in some sense, as the methodical basis for dealing with estimates for more general local approximation schemes. Below we briefly discuss some possible extensions and fields for further investigations.

First of all let us point out that according to (4) (cf. Remark 3) the spaces  $A_{p,q}^{s,k}$  can equivalently be described by the finite element  $L_p$  best approximations. Descriptions of this kind have been used by several authors for characterizing Lipschitz and Besov spaces on special domains by spline and piecewise polynomial best approximations (see, e.g.,  $[7, 8, 12, 15]$ ).

The use of the representation (1), (2) which is an analogon of the Nikolskij representation in the trigonometric case seems to be a new idea for analyzing spline and finite element approximation schemes in a unified and systematic way. The most important requisites for such an approach are the existence of suitable locally supported systems of basis functions for the approximating subspaces (satisfying an analogon of Lemma 1), and, in order to relate the (Approximation) spaces by embedding theorems to the standard function spaces, e.g. to the Sobolev spaces, inequalities of Jackson and Bernstein type for the best approximations with respect to the approximating subspaces (Lemma 2 and 3). Implicitly, this approach has been already explored in [13] where nonlinear spline approximation problems (variable partitions) have been considered for certain spline schemes in one and several dimensions.

The above theory can be extended, without substantial difficulties, to finite elements of  $type (k)$  in higher dimensions. A further possible generalization which is slightly more complicated concerns the case of finite element schemes of higher smoothness order or the case of isoparametric elements (see [2] for the corresponding definitions).

Another interesting question is to relate our results to recent research on spline systems and spline representations in function spaces of Besov-Hardy-Sobolev type (for some results and references, cf.  $[20: 2.12.3]$ ,  $[3]$ ).

For applications, it is important not only to include more general elements but to give estimates for concrete approximation processes used in numerical analysis such as Galerkin-Ritz projections or collocation resp. interpolation methods for elliptic differential and integral equations. Let us also mention the problem of obtaining realistic bounds of the constants occuring in the asymptotic estimates.

 $(33)$
