## **Elliptic Oscillation Theory**

V. B. HEADLEY

Wir gebrauchen eine geeignete Darstellung von Gardings Ungleichung, um Nichtoszillations kriterien für die allgemeine elliptische Differentialgleichung gerader Ordnung

$$
\sum_{\substack{i=1\\i,j\in\mathfrak{b}}}^m (-1)^{|x|} D^{\alpha}[A_{\alpha\beta}(x) D^{\beta}u] = 0 \qquad (x \in \Omega)
$$

von bekannten Nichtoszillationskriterien für die häufiger betrachtete Gleichung  $(-1)^m 4^m u$  $h(x) = 0$  ( $x \in \Omega$ ) abzuleiten, wo  $\Omega$  ein unbeschränktes offenes Gebiet des R<sup>n</sup> ist.

Употребляя один из подходящих вариантов неравенства Гординга (Gårding) мы покажем, как можно вывести новые теоремы неосцилляции для общих эллиптических уравнений четного порядка

$$
\sum_{|\beta|=0}^m (-1)^{|\alpha|} D^{\alpha} [A_{\alpha\beta}(x) D^{\beta} u] = 0 \qquad (x \in \Omega)
$$

из известных теорем неосцилляции для более часто изучаемого уравнения (-1)<sup>т</sup>  $\varDelta^{m}u$  $h(x)$   $u = 0$  ( $x \in \Omega$ ), где  $\Omega$  является неограниченным открытым подмножеством  $\mathbb{R}^n$ .

Using an appropriate version of Garding's inequality, we show how to deduce new non-oscillation theorems for the general even-order elliptic equation

$$
\sum_{i,\vert\beta\vert=0}^m (-1)^{\vert\alpha\vert} D^{\alpha}[A_{\alpha\beta}(x) D^{\beta}u] = 0 \qquad (x \in \Omega) \neq 0
$$

from known non-oscillation theorems for the more frequently studied equation  $(-1)^m \Delta^m u$  $u + h(x)$   $u = 0$   $(x \in \Omega)$ , where  $\Omega$  is an unbounded, open subset of  $\mathbb{R}^n$ .

1. Introduction. Several writers (see, e.g., [2, 3, 5, 8, 9]), have obtained non-oscillation theorems for various forms of the elliptic partial differential equation

$$
(-1)^m \sum_{|\alpha| = |\beta| = m} D^{\alpha} [a_{\alpha\beta}(x) D^{\beta} u] + a_0(x) u = 0 \qquad (x \in \Omega \subseteq \mathbb{R}^n)
$$

in an unbounded open set  $\Omega$ . In a recent paper [6], by using a version of Poincaré's inequality, the author obtained non-oscillation theorems for the more general equation

$$
(-1)^m \sum_{|\alpha|=|\beta|=m} D^{\alpha}[A_{\alpha\beta}(x) D^{\beta}u] + \sum_{|\alpha| \leq m} B_{\alpha}(x) D^{\alpha}u = 0.
$$

In the present paper, by using an appropriate version of Gårding's inequality, we will extend the results in [6] to the equation

$$
Lu:=\sum_{|\alpha|,|\beta|=0}^m (-1)^{|\alpha|} D^{\alpha}[A_{\alpha\beta}(x) D^{\beta}u]=0 \qquad (x \in \Omega \subseteq \mathbb{R}^n), \qquad (1)
$$

where the coefficient functions  $A_{\alpha\beta}$  are real-valued and sufficiently smooth. (The multi-index notation employed here is the same as in [1].) Our main result is a comparison theorem, whose proof, based on a suitable version of Gårding's inequality, will show that every known non-oscillation theorem for the equation

$$
(-1)^m \Delta^m u + h(x) u = 0 \qquad (x \in \Omega \subseteq \mathbb{R}^n)
$$
 (2)

gives rise to a new non-oscillation theorem for (1).

2. Definitions and preliminary results. Throughout this paper,  $G$  will denote any nonempty, open (possibly unbounded) subset of  $\Omega$ . If k is any non-negative integer, we define the seminorm  $|\cdot|_{k,G}$ , the *weighted* seminorm  $|\cdot|_{k,G,w}$ , and the norm  $||\cdot||_{k,G}$  as follows:

$$
|u|_{k,C} = \left[ \sum_{|\alpha|=k\sqrt{G}} \int |D^{\alpha}u|^2 dx \right]^{1/2}, \tag{3}
$$

$$
||u|_{k,G,w} = \left[ \sum_{|\alpha|=k} \int_G (k!/\alpha!) |D^{\alpha}u|^2 dx \right]^{1/2}, \tag{4}
$$

$$
||u||_{k,\mathcal{C}} = \left[\sum_{j=0}^{k} |u|_{j,\mathcal{C}}^{2}\right]^{1/2}.
$$
\n(5)

The definition of  $|\cdot|_{k,G,w}$  is motivated by the following formula, which is valid for all real-valued  $\Phi$  in  $C_0^{\infty}(G)$ :

$$
(-1)^m \int\limits_G \Phi \Delta^m \Phi \, dx = (-1)^m \int\limits_G \Phi \left(\sum_{k=1}^n D_k^2\right)^m \Phi \, dx
$$
  
=  $(-1)^m \int\limits_G \Phi \sum_{|\alpha| = m} (m!/\alpha!) \, D^{2\alpha} \Phi \, dx$   
=  $(-1)^m \sum\limits_{|\alpha| = m} \int\limits_G \Phi D^{\alpha}[(m!/\alpha!) \, D^{\alpha} \Phi] \, dx$   
=  $\sum\limits_{|\alpha| = m} \int\limits_G (m!/\alpha!) \, |D^{\alpha} \Phi|^2 \, dx$ .

To compare the seminorms  $|\cdot|_{m,G}$  and  $|\cdot|_{m,G,w}$ , we let

$$
c_0 = \max \{m!/\alpha! : |\alpha| = m\}.
$$
 (6)

Then it is easily seen that

$$
|u|_{m,G}\leq |u|_{m,G,w}\leq c_0^{1/2}|u|_{m,G}.
$$

We also note that, in (3) and (5), when there is no danger of confusion, we omit the subscript  $G$ . Let  $C_B^{\ k}(G) = \{u \in C^k(G) : ||u||_{k,G} < \infty\}$ , and let  $H_k(G)$  and  $H_k^0(G)$  denote the completions of  $C_B^{\ k}(G)$  and  $C_0^{\infty}(G)$ , respectively, with respect to the norm  $\lVert \cdot \rVert_{k,G}$ .

If G is bounded, and if there exists a non-trivial function  $u$  in  $H_m^0(G) \cap C_i^{2m}(G)$ such that (1) holds, then G is called a *nodal domain* for L or a nodal domain for (1). If for all positive r the region  $\{x \in \Omega : |x| > r\}$  contains a nodal domain for L, then (1) is said to be nodally oscillatory (or strongly oscillatory) in  $\Omega$ .

Using integration by parts, we can easily show that if G is any non-empty, open (possibly unbounded) subset of  $\Omega$ , then for every real-valued  $\Phi$  in  $C_0^{\infty}(G)$  we have

$$
\int_{G} \Phi L \Phi dx = \sum_{|\alpha| = |\beta| = m} \int_{G} A_{\alpha\beta}(x) D^{\alpha} \Phi D^{\beta} \Phi dx + \int_{G} \Phi^2 A_{00}(x) dx
$$
\n
$$
+ \sum_{|\alpha| + |\beta| = 1} \int_{G} A_{\alpha\beta} D^{\alpha} \Phi D^{\beta} \Phi dx.
$$

 $(7)$ 

The standard proof of the *global* version of Gårding's inequality [1: Theorem 7.6] now yields the following result.

Lemma 2.1: Let  $E_0$  denote the ellipticity constant of the differential operator  $L$ ; in *other words, let* The standard proof of the global version of Garding's inequality [1: Theorem 7.6]<br>
now yields the following result.<br>

$$

Using (1), (12) and a continuity argument, we obtain  $0 = \int uLu dx \geq \int uMu dx$ . Therefore, the smallest eigenvalue of the eigenvalue problem  $Mv = \lambda v$ ,  $v \in H_m^0(G)$  $\cap C^{2m}(G)$  is non-positive. Hence, we can apply a known monotonicity principle [4] to show that G has a non-empty open subset *0'* such that zero is the smallest eigenvalue of the eigenvalue problem  $Mw = \mu w$ ,  $w \in H_m^0(G') \cap C^{2m}(G')$ . Thus, we have shown that, for every positive number *r*, the equation  $Mw = 0$  has a non-trivial solution *w*, with a nodal domain  $G' \subset G \subset \{x \in \Omega : |x| > r\}$ Using (1), (12) and a continuity argument, we obtain  $0 = \int uLu \, dx \ge \int uMu \, dx$ .<br>
Therefore, the smallest eigenvalue of the eigenvalue problem  $Mv = \lambda v$ ,  $v \in H_m^0(G)$ <br>
n  $C^{2m}(G)$  is non-positive. Hence, we can apply a known mono
