An Integral Estimate for the Gradient for a Class of Nonlinear Elliptic Equations in the Plane

L. Softova \mathcal{L}^{max} .

Abstract. An a priori estimate is established for the gradient of the solution to Dirichlet's problem for a class of nonlinear differential equations on a convex domain in the plane. The nonlinear operator is assumed to be elliptic in the sense of Campanato. By virtue of the Leray-Schauder fixed point theorem an existence result for the problem under consideration is derived.

Keywords: *Nonlinear elliptic equations, a priori estimates, Aleksandrov-I'ucci maximum principle*

1. Introduction

The present paper deals with strong solutions of the Dirichlet problem for second order nonlinear equations of the form *a(x,u(x),Du(x),D2u(x)) = f(x,u(x),Du(x))* ac. in ft (0)

$$
a(x, u(x), Du(x), D2u(x)) = f(x, u(x), Du(x)) \quad \text{a.e. in } \Omega.
$$
 (0)

Here Ω is a bounded, convex and sufficiently smooth domain, and the functions a and f satisfy the Carathéodory condition. Equation (0) is assumed to be elliptic in the sense of Campanato (condition (A) below).

Strong solvability results for equation (0) were proved by Bers and Nirenberg [2] under the assumption that *a* and *f* are differentiable functions with respect to all their variables. A similar result belongs to Ladyzenskaya and Uralt'zeva when *a* and *f* are continuous functions. Imposing an ellipticity condition of special kind on *a,* Carnpanato was able to handle with operators defined by Carathéodory functions. Local existence results were derived in [3, 4] for domains with small Lehesgue measure. Recently, global strong solvability for equation (0) was proved by Palagachev in [8] if the right-hand side *f* grows strictly suhquadratically with respect to the gradient.

Our main goal here is to improve the results iii [8] allowing *quadratic gradient growth* in *f.* Existence of strong solution to the Dirichiet problem for equation (0) is reached by Lcray-Schauder's fixed point theorem and is based on a Carnpanato's theory of

nearness between operators (see [3, 4]) and on an a priori estimate for the $L^4(\Omega)$ norm of the gradient Du . In deriving this estimate we use essentially Campanato's ellipticity condition which enables to linearize the equation in a suitable manner and then apply a topological approach due to Amann and Crandall [1].

2. Setting of the problem and main results

Let $\Omega \subset \mathbb{R}^2$ be a bounded and convex domain of class C^2 . Suppose that $a = a(x, z, p, \xi)$ and $f = f(x, z, p)$ are real-valued functions which satisfy the Caratheodory condition
i.e. they are measurable in x for all $(z, p, \xi) \in \mathbb{R} \times \mathbb{R}^2 \times \mathbb{R}^4$ and continuous in the other
variables for almost all $x \in \Omega$. i.e. they are measurable in x for all $(z, p, \xi) \in \mathbb{R} \times \mathbb{R}^2 \times \mathbb{R}^4$ and continuous in the other variables for almost all $x \in \Omega$. Our aim is to study the following Dirichlet problem for second order nonlinear differential equations $\begin{align*} \text{e for the } L^4(\Omega) \text{ norm} \end{align*} \begin{align*} \text{mpanato's ellipticity} \end{align*} \begin{align*} \text{mner and then apply} \end{align*} \begin{align*} \text{a: } \text{the } a = a(x, z, p, \xi) \end{align*} \begin{align*} \text{the other} \end{align*} \begin{align*} \text{infinite} \end{align*} \begin{align$ Example 1 and main results

$$

$$
u = 0 \qquad \text{on } \partial \Omega.
$$
 (1)

Here the symbols Du and D^2u denote the gradient and Hessian matrix of *u*, respectively, and \mathbb{R}^4 stands for the 4-dimensional space of real and symmetric (2×2) -matrices $\xi = {\xi_{ij}}_{i,j=1}^2$ with the norm $\|\xi\| = (\sum_{i,j=1}^2 \xi_{ij}^2)^{\frac{1}{2}}$. We will consider strong solutions of problem (1), i.e. twice weakly differentiable functions $u \in W^{2,q}(\Omega)$ satisfying the equation in (1) a.e. in Ω and achieving their boundary values in the sense of $W^{1,q}(\Omega)$, i.e. $u \in W_0^{1,q}(\Omega)$, for suitable $q \geq 1$. *Trandalla signalla to Treat and symmetric* $(Z \times Z)$,

 Triangla ii A and

Concerning the function $a = a(x, z, p, \xi)$ our investigations will be carried out, assuming the validity of the following ellipticity condition introduced by Campanato $(see [3]):$

(A) There exist positive constants α, γ and $\delta, \gamma + \delta < 1$, such that

$$
\left|Tr(\xi) - \alpha \left[a(x, z, p, \xi + \tau) - a(x, z, p, \tau) \right] \right| \leq \gamma ||\xi|| + \delta |Tr(\xi)|
$$

for almost all $x \in \Omega$, for all $z \in \mathbb{R}$, $p \in \mathbb{R}^2$ and $\xi, \tau \in \mathbb{R}^4$, and $a(x, z, p, 0) = 0$.

Concerning the function $f = f(x, z, p)$ we impose the following requirements:

- (B) $|f(x,z,p)| \leq f_1(|z|)(f_2(x) + |p|^2)$, where $f_1 \in C^0(\mathbb{R}^+)$ is a positive, monotone non-decreasing function and $f_2 \in L^2(\Omega)$ is positive.
- (C) $-\text{sign } z \cdot f(x,z,p) \leq 2\frac{\sqrt{\det |a_{ij}|} \sqrt{g(z)}}{h(p)}$ for a.a. $x \in \Omega, |z| \geq M$ and $p \in \mathbb{R}^2$, where $a_{ij}(x, z, p, \xi) = \frac{\partial a}{\partial \xi_{ij}}(x, z, p, \xi), \quad a_{ij} \in L^{\infty}(\Omega \times \mathbb{R} \times \mathbb{R}^2 \times \mathbb{R}^4), \quad g \in L^1(\Omega)$ and $h \in L^1_{loc}(\mathbb{R}^2)$ are positive functions such that $\int_{\Omega} g(x) dx < \int_{\mathbb{R}^2} h(p) dp$ (see [10]).

Let us note that, according to [8: Lemma], Campanato's condition (A) ensures that $a =$ $a(x, z, p, \xi)$ is a Lipschitz-continuous function with respect to ξ . Hence, in view of the classical Rademacher theorem, the derivatives $\frac{\partial a}{\partial \xi_{ij}}(x, z, p, \xi)$ exist almost everywhere, $a_{ij}(x, z, p, \xi) = \frac{\partial a}{\partial \xi_{ij}}(x, z, p, \xi), \quad a_{ij} \in L^{\infty}(\Omega \times \mathbb{R} \times \mathbb{R}^2 \times \mathbb{R}^4), \quad g \in L^1(\Omega)$ and
 $h \in L^1_{loc}(\mathbb{R}^2)$ are positive functions such that $\int_{\Omega} g(x) dx < \int_{\mathbb{R}^2} h(p) dp$ (see [10]).

Let us note that, accor and they are essentially bounded.

Now we can formulate our main result.

Theorem 1 (Gradient estimate). Assume $\Omega \subset \mathbb{R}^2$ to be a bounded and convex *domain of class* C^2 , and let conditions (A) and (B) *be fulfilled. Then there exists a* constant $C = C(\alpha, \gamma, \delta, \partial \Omega, f_1, f_2, ||u||_{L^{\infty}(\Omega)})$ such that $||Du||_{L^4(\Omega)} \leq C$ (2) *constant* $C = C(\alpha, \gamma, \delta, \partial\Omega, f_1, f_2, ||u||_{L^{\infty}(\Omega)})$ *such that* A
 $\subset \mathbb{R}^2$ to \Box
 \Box

$$
||Du||_{L^4(\Omega)} \le C \tag{2}
$$

for each strong solution $u \in W^{2,2}(\Omega) \cap W_0^{1,2}(\Omega)$ *of the Dirichlet problem* (1).

The a priori gradient estimate already stated allows us to apply the Leray-Schauder fixed point theorem in order to derive strong solvability of problem (1).

Theorem 2 (Existence). Let $\Omega \subset \mathbb{R}^2$ be a bounded and convex domain of class C^2 , and let conditions (A), (B) and (C) be satisfied. Then the Dirichlet problem (1) admits a solution $u \in W^{2,2}(\Omega) \cap W_0^{1,2}(\Omega)$. **a** solution is the constant $C = C(\alpha, \gamma, \delta, \partial\Omega, f_1, f_2, ||u||_{L^{\infty}(\Omega)})$ such that $||Du||_{L^4(\Omega)} \leq C$
for each strong solution $u \in W^{2,2}(\Omega) \cap W_0^{1,2}(\Omega)$ of the Dirichlet problem
The a priori gradient estimate already stated

To conclude this section let us note that the strong solution u of problem (1) is a Hölder-continuous function $u \in C^{0,\lambda}(\overline{\Omega})$ for all $\lambda < 1$ in view of Sobolev's imbedding theorem. Hence, u attains its boundary values on $\partial\Omega$ continuously.

In addition to the assumptions in Theorem 2, suppose that $a = a(x, z, p, \xi)$ is independent of *z* and p , $f(x, z, p)$ is non-decreasing in *z* and Lipschitz continuous with respect to *p.* Then the solution of the Dirichlet problem (1) is unique in the wider class $C^{0}(\overline{\Omega}) \cap W^{2,2}_{loc}(\Omega)$. We refer to [8: Theorem 2] for the details.

3. Proofs of the results

We start with proving the gradient a priori estimate (2). For this goal an approach due to Amann and Crandall (1] will be used.

Let $u \in W^{2,2}(\Omega) \cap W^{1,2}_0(\Omega)$ solve the Dirichlet problem (1). The equation in (1) can be rewritten in the form

$$
a(x, u, Du, D^2u) - \frac{f(x, u, Du)(f_2(x) + |Du|^2)}{f_2(x) + |Du|^2} = 0,
$$

which gives

Proofs of the results
\nstart with proving the gradient a priori estimate (2). For this goal an approach d
\nAmann and Crandall [1] will be used.
\nLet
$$
u \in W^{2,2}(\Omega) \cap W_0^{1,2}(\Omega)
$$
 solve the Dirichlet problem (1). The equation in (a)
\nthe rewritten in the form
\n
$$
a(x, u, Du, D^2u) - \frac{f(x, u, Du)(f_2(x) + |Du|^2)}{f_2(x) + |Du|^2} = 0,
$$
\nwhich gives
\n
$$
a(x, u, Du, D^2u) - \frac{f(x, u, Du)|Du|^2}{f_2(x) + |Du|^2} - f_2(x)u(x) = \frac{f(x, u, Du)f_2(x)}{f_2(x) + |Du|^2} - f_2(x)u(x).
$$
\nwe, defining the functions
\n
$$
b(x) = -\frac{f(x, u, Du)}{f_2(x) + |Du|^2} \quad \text{and} \quad F(x) = \frac{f(x, u, Du)f_2(x)}{f_2(x) + |Du|^2} - f_2(x)u(x),
$$
\ne equation in (1) takes on the form

Now, defining the functions

$$
u, Du, D^2u) - \frac{f(x, u, Du) |Du|}{f_2(x) + |Du|^2} - f_2(x)u(x) = \frac{f(x, u, Du) |u|^2}{f_2(x) + |Du|^2} - f_2(x)u
$$

defining the functions

$$
b(x) = -\frac{f(x, u, Du)}{f_2(x) + |Du|^2} \quad \text{and} \quad F(x) = \frac{f(x, u, Du) f_2(x)}{f_2(x) + |Du|^2} - f_2(x)u(x),
$$

the equation in (1) takes on the form

$$
a(x, u, Du, D2u) + b(x)|Du|2 - f2(x)u(x) = F(x),
$$

where, according to condition (B), we have $|b(x)| \le f_1(\|u\|_{L^\infty}) < \infty$ for a.a. $x \in \Omega$, i.e. $b \in L^{\infty}(\Omega)$ and $F \in L^2(\Omega)$. Thus, the Dirichlet problem (1) is equivalent to the following one: $\begin{aligned} \n\subseteq f_1(\|u\|_{L^\infty}) < \infty \text{ for a.};\\ \n\text{or } \text{problem (1) is equivalent},\\ \n\lim_{u \to 0} \begin{cases} \n\lim_{\delta \to 0} \frac{\delta u}{\delta} < \delta \n\end{cases} \n\end{aligned}$ *a(x, u, Du, D2 v) + b(^x)I Dv* ^l *2 — f2 (x)v(x) = pF(x)* ac. in ci

$$
a(x, u, Du, D2u) + b(x)|Du|2 - f2(x)u(x) = F(x) \quad \text{a.e. in } \Omega
$$

$$
u = 0 \qquad \text{on } \partial\Omega.
$$
 (3)

Let $\rho \in [0, 1]$ be a parameter and consider the problem

following one:

\n
$$
a(x, u, Du, D^2u) + b(x)|Du|^2 - f_2(x)u(x) = F(x) \quad \text{a.e. in } \Omega
$$
\n
$$
u = 0 \qquad \text{on } \partial\Omega.
$$
\nLet $\rho \in [0, 1]$ be a parameter and consider the problem

\n
$$
a(x, u, Du, D^2v) + b(x)|Dv|^2 - f_2(x)v(x) = \rho F(x) \quad \text{a.e. in } \Omega
$$
\n
$$
v = 0 \qquad \text{on } \partial\Omega.
$$
\nNote that the function $v = 0$ solves problem (4) if $\rho = 0$. On the other hand, problem

(4) coincides with the original problem (3) for $\rho = 1$. Thus, if we know in addition uniqueness result for problem (4), then the solution *v* of problem (4) with $\rho = 1$ will coincide with the solution *u* of problem (3). *corresponding to the respective values* $\rho_1 \leq \rho_2 - \rho_1$ (4) if $\rho = 0$. On the other (4) coincides with the original problem (3) for $\rho = 1$. Thus, if we know induceness result for problem (4), then the solution *v* o *Il* I , Du , D^2v) + $b(x)|Dv|^2 - f_2(x)v(x) = \rho F(x)$ a.e. in Ω
 $v = 0$ on $\partial \Omega$.

Inction $v = 0$ solves problem (4) if $\rho = 0$. On the other hand, pro

th the original problem (3) for $\rho = 1$. Thus, if we know in add

$$

According to [8: Lemma], the function $\xi \to a(x, z, p, \xi)$ is differentiable a.e. with respect to ξ and the derivatives $\frac{\partial a}{\partial \xi_{ij}}(x,z,p,\xi)$ $(i,j = 1,2)$ belong to $L^{\infty}(\Omega \times \mathbb{R} \times \mathbb{R}^2 \times \mathbb{R}^4)$. Therefore, we derive from (6)

$$
\int_{0}^{1} \frac{\partial a}{\partial \xi_{ij}}(x, u, Du, s(D^{2}v_{1} - D^{2}v_{2}) + D^{2}v_{2})D_{ij}(v_{1} - v_{2}) ds
$$

+ $b(x) \int_{0}^{1} \frac{\partial}{\partial s} |s(Dv_{1} - Dv_{2}) + Dv_{2}|^{2} ds - f_{2}(x)[v_{1}(x) - v_{2}(x)] = F(x)(\rho_{1} - \rho_{2}).$
Setting $w = v_{1} - v_{2}$ and introducing the notations

$$
v_2 \text{ and introducing the notations}
$$

\n
$$
A_{ij}(x) = \int_0^1 \frac{\partial a}{\partial \xi_{ij}} (x, u, Du, s(D^2 v_1 - D^2 v_2) + D^2 v_2) ds
$$

\n
$$
b_i(x) = 2b(x) \int_0^1 [s(D_i v_1 - D_i v_2) + D_i v_2] ds,
$$

the equation in (6) takes on the form

$$
Lw \equiv A_{ij}(x)D_{ij}w + b_i(x)D_iw - f_2(x)w(x) = F(x)(\rho_1 - \rho_2).
$$

To apply the Aleksandrov-Pucci maximum principle (see [5: Theorem 9.1]) we need an estimate for the right-hand side $F(x)(\rho_1 - \rho_2)$ from above:

$$
F(x) = \frac{f(x, u, Du)f_2(x)}{f_2(x) + |Du|^2} - f_2(x)u(x)
$$

\n
$$
\leq \frac{|f(x, u, Du)|f_2(x)}{f_2(x) + |Du|^2} + f_2(x)|u(x)|
$$

\n
$$
\leq \frac{f_1(|u|)[f_2(x) + |Du|^2]f_2(x)}{f_2(x) + |Du|^2} + f_2(x)|u(x)|
$$

\n
$$
\leq f_2(x)[f_1(|u|) + |u|]
$$

\n
$$
\leq f_2(x)[f_1(||u||_{L^{\infty}(\Omega)}) + ||u||_{L^{\infty}(\Omega)}].
$$

Since $(\rho_1 - \rho_2)$ is negative, we get

$$
Lw \geq (\rho_1 - \rho_2) f_2(x) [f_1(||u||_{L^{\infty}(\Omega)}) + ||u||_{L^{\infty}(\Omega)}]
$$

= $-f_2(x) (\rho_2 - \rho_1) [f_1(||u||_{L^{\infty}(\Omega)}) + ||u||_{L^{\infty}(\Omega)}].$

Denoting $M = (\rho_2 - \rho_1)[f_1(\|u\|_{L^{\infty}(\Omega)}) + \|u\|_{L^{\infty}(\Omega)}]$, it is clear that

$$
LM = -f_2(x)(\rho_2 - \rho_1)[f_1(||u||_{L^{\infty}(\Omega)}) + ||u||_{L^{\infty}(\Omega)}]
$$

and $Lw \geq LM$. Now applying the Aleksandrov-Pucci maximum principle to the problem

$$
L(w - M) \ge 0 \quad \text{a.e. in} \quad \Omega
$$

$$
w - M \le 0 \quad \text{on} \quad \partial\Omega
$$

we get $w - M \leq 0$ a.e. in Ω and hence $w \leq M$. Considering the same problem with $-w$ instead of *w*, we get an estimate for *w* from below, that yields $w \geq -M$, whence $||w||_{L^{\infty}(\Omega)} \leq M$

Corollary 4. If problem (4) has a solution $v \in W^{2,2}(\Omega) \cap W^{1,2}_0(\Omega)$ for some $\rho \in$ [0, 1], *then it is a unique solution.*

Proof. It follows immediately from (5) putting $\rho_1 = \rho_2$

We are in a position now to prove estimate (2). Let $\rho_1 < \rho_2$ and denote the corresponding solutions of problem (4) by $v_1, v_2 \in W^{2,2}(\Omega) \cap W_0^{1,2}(\Omega)$. As above we set $w = v_1 - v_2$ and consider the problem

$$
a(x, u, Du, D2 v1) - a(x, u, Du, D2 v2)
$$

= $F(x)(\rho_1 - \rho_2)$
- $b(x)[|Dv_1|^2 - |Dv_2|^2] + f_2(x)[v_1(x) - v_2(x)]$ a.e. in Ω
 $v_1 - v_2 = 0$ on $\partial\Omega$. (7)

Introduce the new function

$$
G(x) = (\rho_1 - \rho_2)F(x) - b(x)[|Dv_1|^2 - |Dv_2|^2] + f_2(x)w(x)
$$

and consider the equation

$$
\Delta w = \Delta w - \alpha \Big[a(x, u, Du, D^2 v_1) - a(x, u, Du, D^2 v_2) \Big] + \alpha G(x).
$$

Having in mind that $Tr(D^2w) = \Delta w$, condition (A), and Young's inequality we get

$$
\Delta w = \Delta w - \alpha \Big[a(x, u, Du, D^2 v_1) - a(x, u, Du, D^2 v_2) \Big] + \alpha G(x).
$$
\ng in mind that $Tr(D^2 w) = \Delta w$, condition (A), and Young's inequality we

\n
$$
|\Delta w|^2 = \Big| \Delta w - \alpha \Big[a(x, u, Du, D^2 v_1) - a(x, u, Du, D^2 v_2) \Big] \Big|^2 + \alpha^2 |G(x)|^2
$$
\n
$$
+ 2 \Big| \Delta w - \alpha \Big[a(x, u, Du, D^2 v_1) - a(x, u, Du, D^2 v_2) \Big] \Big| G(x) \Big|
$$
\n
$$
\leq |\Delta w - \alpha \Big[a(x, u, Du, D^2 v_1) - a(x, u, Du, D^2 v_2) \Big] \Big| G(x) \Big|
$$
\n
$$
+ \varepsilon \Big| \Delta w - \alpha \Big[a(x, u, Du, D^2 v_1) - a(x, u, Du, D^2 v_2) \Big] \Big|^2 + \alpha^2 |G(x)|^2
$$
\n
$$
+ \varepsilon \Big| \Delta w - \alpha \Big[a(x, u, Du, D^2 v_1) - a(x, u, Du, D^2 v_2) \Big] \Big|^2 + \frac{1}{\varepsilon} |G(x)|^2
$$
\n
$$
\leq (1 + \varepsilon) (\gamma ||D^2 w|| + \delta |\Delta w|)^2 + C(\varepsilon, \alpha) |G(x)|^2
$$
\n
$$
\leq (1 + \varepsilon) \gamma (\gamma + \delta) ||D^2 w||^2 + (1 + \varepsilon) \delta (\delta + \gamma) |\Delta w|^2 + C(\varepsilon, \alpha) |G(x)|^2
$$
\nittrary $\varepsilon > 0$. Thus

\n
$$
\int_{\Omega} |\Delta w|^2 dx \leq \int_{\Omega} (1 + \varepsilon) \gamma (\gamma + \delta) ||D^2 w||^2 dx + C(\alpha, \varepsilon) \int |G(x)|^2 dx
$$

for arbitrary $\varepsilon > 0$. Thus

$$
\leq (1+\varepsilon)\gamma(\gamma+\delta)\|D^2w\|^2 + (1+\varepsilon)\delta(\delta+\gamma)|\Delta w|^2 + C(\varepsilon,\alpha)|G(x)|
$$

ary $\varepsilon > 0$. Thus

$$
\int_{\Omega} |\Delta w|^2 dx \leq \int_{\Omega} (1+\varepsilon)\gamma(\gamma+\delta) \|D^2w\|^2 dx
$$

$$
+ \int_{\Omega} (1+\varepsilon)\delta(\delta+\gamma)|\Delta w|^2 dx + C(\alpha,\varepsilon)\int_{\Omega} |G(x)|^2 dx.
$$

$$
W^{2,2}(\Omega) \cap W_0^{1,2}(\Omega), \text{ and } \Omega \text{ is a convex domain, the Miranda-Talenti}
$$

$$
\int_{\Omega} \|D^2w\|^2 dx \leq \int_{\Omega} |\Delta w|^2 dx
$$
plied. It follows

 $\text{Since } w \in W^{2,2}(\Omega) \cap W^{1,2}_0(\Omega), \text{ and } \Omega \text{ is a convex domain, the Miranda-Talenti inequality}$ (see (6, 9])

$$
\int_{\Omega} \|D^2 w\|^2 dx \le \int_{\Omega} |\Delta w|^2 dx \tag{8}
$$

can be applied. It follows

$$
\int_{\Omega} |\Delta w|^2 dx \le (1+\varepsilon)(\gamma+\delta)^2 \int_{\Omega} |\Delta w|^2 dx + C(\alpha,\varepsilon) \int_{\Omega} |G(x)|^2 dx,
$$

and if $\varepsilon > 0$ is so small that $(1 + \varepsilon)(\gamma + \delta)^2 < 1$, we obtain

$$
\left[1-(1+\varepsilon)(\gamma+\delta)^2\right]\int_{\Omega}|\Delta w|^2dx\leq C(\alpha,\varepsilon)\int_{\Omega}|G(x)|^2dx.
$$

Therefore, for a constant C_1 , depending on α , ε , γ and δ , it results

$$
\int_{\Omega} |\Delta w|^2 dx \leq C_1(\alpha, \varepsilon, \gamma, \delta) \int_{\Omega} |G(x)|^2 dx.
$$

$$
\text{Using (8) once again, we get an estimate for } D^2 w:
$$
\n
$$
\int_{\Omega} \|D^2 w\|^2 dx \leq C_1(\alpha, \varepsilon, \gamma, \delta) \int_{\Omega} |G(x)|^2 dx,
$$
\ni.e.\n
$$
\|D^2 w\|_{L^2(\Omega)}^2 \leq C_1(\alpha, \varepsilon, \gamma, \delta) \|G(x)\|_{L^2(\Omega)}^2.
$$
\nThus, the function w satisfies the inequality\n
$$
\|w\|_{W^2(\Omega)} \leq C_1(\alpha, \varepsilon, \gamma, \delta) \|G(x)\|_{L^2(\Omega)}^2.
$$

i.e.

2 $\mathcal{C}_{(0)} \leq C_1(\alpha, \varepsilon, \gamma, \delta) \|G(x)\|_{L^2(\Omega)}^2.$

Thus, the function *w* satisfies the inequality

$$
||D^2w||_{L^2(\Omega)}^2 \leq C_1(\alpha, \varepsilon, \gamma, \delta) ||G(x)||_{L^2(\Omega)}^2
$$

\nthe function w satisfies the inequality
\n
$$
||w||_{W^{2,2}(\Omega)}
$$
\n
$$
\leq C \Big(||F(x)||_{L^2(\Omega)} + ||b(x)||Dv_2|^2 - |Dv_1|^2 \Big] ||_{L^2(\Omega)} + ||f_2w||_{L^2(\Omega)} \Big)
$$
\n
$$
\leq C_2 \Big(||f_2||_{L^2(\Omega)}, ||w||_{L^\infty(\Omega)}, ||b(x)||_{L^\infty(\Omega)} \Big) \Big(1 + ||Dv_1||_{L^4(\Omega)}^2 + ||Dw||_{L^4(\Omega)}^2 \Big).
$$

\nL⁴-norm of Dw in the right-hand side above can be estimated by the he
\nardo-Nirenberg's inequality [7]
\n
$$
||Dw||_{L^4(\Omega)} \leq K^{\frac{1}{2}} ||D^2w||_{L^2(\Omega)}^{\frac{1}{2}} ||w||_{L^\infty(\Omega)}^{\frac{1}{2}}.
$$

The L⁴-norm of *Dw* in the right-hand side above can be estimated by the help of Gagliardo-Nirenberg's inequality [7]
 $||Dw||_{L^{4}(\Omega)} \leq K^{\frac{1}{2}} ||D^{2}w||^{\frac{1}{2}}_{L^{2}(\Omega)} ||w||^{\frac{1}{2}}_{L^{\infty}(\Omega)}$. Gagliardo-Nirenberg's inequality [7]

$$
||Dw||_{L^{4}(\Omega)} \leq K^{\frac{1}{2}}||D^{2}w||_{L^{2}(\Omega)}^{\frac{1}{2}}||w||_{L^{\infty}(\Omega)}^{\frac{1}{2}}
$$

In other words, utilizing (5) we derive

$$
||Dw||_{L^{4}(\Omega)}^{2} \leq K||D^{2}w||_{L^{2}(\Omega)}||w||_{L^{\infty}(\Omega)}
$$

$$
\leq K(\rho_{2}-\rho_{1}) \left[f_{1}(||u||_{L^{\infty}(\Omega)}) + ||u||_{L^{\infty}(\Omega)}\right]||D^{2}w||_{L^{2}(\Omega)}
$$

which leads to

$$
||Dw||_{L^{4}(\Omega)}^{2} \leq K||D^{2}w||_{L^{2}(\Omega)}||w||_{L^{\infty}(\Omega)}
$$

\n
$$
\leq K(\rho_{2} - \rho_{1}) \left[f_{1}(||u||_{L^{\infty}(\Omega)}) + ||u||_{L^{\infty}(\Omega)} \right] ||D^{2}w||_{L^{2}(\Omega)}
$$

\nwhich leads to
\n
$$
||w||_{W^{2,2}(\Omega)} \leq C_{2} \left\{ 1 + ||Dv_{1}||_{L^{4}(\Omega)}^{2}
$$
\n
$$
+ K(\rho_{2} - \rho_{1}) \left[f_{1}(||u||_{L^{\infty}(\Omega)}) + ||u||_{L^{\infty}(\Omega)} \right] ||D^{2}w||_{L^{2}(\Omega)} \right\}.
$$

\nThus, having in mind $||D^{2}w||_{L^{2}(\Omega)} \leq ||w||_{W^{2,2}(\Omega)}$, we get

 $\leq \|w\|_{W^{2,2}(\Omega)},$ we get

$$
\begin{aligned} \n\mathcal{L}(\rho_2 - \rho_1) \left[J_1(\|\mathbf{u}\|_{L^\infty(\Omega)}) + \|\mathbf{u}\|_{L^\infty(\Omega)} \right] \n\\ \n^2 w \|_{L^2(\Omega)} &\leq \|w\|_{W^{2,2}(\Omega)}, \text{ we get} \n\\ \n\|\|D^2 w\|_{L^2(\Omega)} &\leq C_3 \left(1 + \|Dv_1\|_{L^4(\Omega)}^2 \right) \n\end{aligned}
$$

Thus, having in mind $||D^2w||_{L^2(\Omega)}$
 $||D^2w||_l$
assuming in addition $\rho_2 - \rho_1 \le ||u||_{L^{\infty}(\Omega)} < 1$. Hence *r* to be so small that $C_2 K(\rho_2 - \rho_1) [f_1(||u||_{L^{\infty}(\Omega)}) +$ $||u||_{L^{\infty}(\Omega)} \leq 1$. Hence n add
 < 1 .
 $\frac{2}{L^4(\Omega)}$

+
$$
R(\rho_2 - \rho_1) [J_1(||u||_{L^{\infty}(\Omega)}) + ||u||_{L^{\infty}(\Omega)}] ||D^{\circ}w||_{L^2(\Omega)} \}
$$

\n
$$
\text{as, having in mind } ||D^2w||_{L^2(\Omega)} \le ||w||_{W^{2,2}(\Omega)}, \text{ we get}
$$
\n
$$
||D^2w||_{L^2(\Omega)} \le C_3(1 + ||Dv_1||_{L^4(\Omega)}^2)
$$
\n
$$
\text{using in addition } \rho_2 - \rho_1 \le \tau \text{ to be so small that } C_2K(\rho_2 - \rho_1)[f_1(||u||_{L^{\infty}(\Omega)}) +
$$
\n
$$
L^{\infty}(\Omega) < 1. \text{ Hence}
$$
\n
$$
||Dv_2||_{L^4(\Omega)}^2 \le ||Dv_1||_{L^4(\Omega)}^2 + K(\rho_2 - \rho_1)[f_1(||u||_{L^{\infty}(\Omega)}) + ||u||_{L^{\infty}(\Omega)}]C_3(1 + ||Dv_1||_{L^4(\Omega)}^2)
$$
\n
$$
\le ||Dv_1||_{L^4(\Omega)}^2 + ||Dw||_{L^4(\Omega)}^2
$$
\n
$$
\le C_4 + C_5 ||Dv_1||_{L^4(\Omega)}^2.
$$
\n
$$
1. \text{(9) means that if for some } \rho_1 \in \Omega, \text{ and } \text{ by } \rho_2 \in \rho_1 \text{ satisfies the function}
$$
\n
$$
1. \text{(10) means that if for some } \rho_2 \in \Omega, \text{ and } \text{ by } \rho_2 \in \rho_2 \text{ satisfies the function}
$$

Bound (9) means that, if for some $\rho_1 \in [0,1]$ we have an a priori estimate for the respective solution v_1 of problem (4), we can get an estimate for the other solution v_2 Bound (9) means that, if for some $\rho_1 \in [0,1]$ we have are
respective solution v_1 of problem (4), we can get an estimat
of the same problem with $\rho_2 > \rho_1$ ($\rho_2 \in [0,1]$) if $\rho_2 - \rho_1 \leq$ *T.*

64 L. Softova $\frac{1}{2}$

To proceed further, we set $\rho_1 = 0$ and $\rho_2 = \tau$. In view of the uniqueness result (Corollary 4), the solution v_0 of problem (4) with $\rho = 0$ is equal to zero and thus (9) yields = 0 and $\rho_2 = \tau$. In view of

coblem (4) with $\rho = 0$ is equency
 $||Dv_{\tau}||_{L^4(\Omega)}^2 \leq C_4$
 τ , of problem (4) with $\rho = \tau$.
 τ , $m-1$, and repeating the about $||Du||_{L^4(\Omega)} \leq C_6$.

$$
||Dv_r||_{L^4(\Omega)}^2 \le C_4 \tag{10}
$$

whenever there exists the solution v_r of problem (4) with $\rho = \tau$. Thus, choosing $\rho_1 = k\tau$ we derive the desired estimate (2): $||Du||_{L^{4}(\Omega)} \leq C_6$.

 $||Dv_r||_{L^4(\Omega)}^2 \leq C_4$
 are exists the solution v_r of problem (4) with $\rho = \tau$. Thus, choosing $\rho_1 =$
 $+1)\tau$, with $k = 0, 1, ..., m - 1$, and repeating the above procedure *m* tir
 e desired estimate (2): $||Du||_{L^4(\Omega)} \le$ and $\rho_2 = (k+1)\tau$, with $k = 0, 1, ..., m-1$, and repeating the above procedure *m* times, we derive the desired estimate (2): $||Du||_{L^4(\Omega)} \leq C_6$.

It remains to prove strong solvability of problem (4) with $\rho = \tau$. This will b *a*(*x,u, Du, D² <i>x*) \rightarrow *a*(*x*) \rightarrow *a*(*x,u, Du, D² <i>x*) \rightarrow *a*(*x,u, Du, D² <i>v*, \rightarrow *b*(*x*) $|Dv_r|^2 - f_2(x)v_r = \tau F(x)$ a.e. in Ω **a**(*x,u, Du, D² <i>v*, \rightarrow *b*(*x*) $|Dv_r|^2 - f_2(x)v_r = \tau F(x)$ a.e. in Ω **a** *z* = 0, 1,..., *m* - 1, and repeating the above proceduate (2): $||Du||_{L^4(\Omega)} \leq C_6$.
 z = *z* It remains to prove strong solvability of problem (4) with $\rho = \tau$. This will be carried
by using the Leray-Schauder fixed point theorem. Consider problem (4) with $\rho = \tau$,
 $a(x, u, Du, D^2v_{\tau}) + b(x)|Dv_{\tau}|^2 - f_2(x)v_{\tau} = \tau F(x)$ a. out by using the Leray-Schauder fixed point theorem. Consider problem (4) with $\rho = \tau$. i.e.

$$
a(x, u, Du, D^2v_\tau) + b(x)|Dv_\tau|^2 - f_2(x)v_\tau = \tau F(x) \quad \text{a.e. in } \Omega
$$

$$
v_\tau = 0 \qquad \text{on } \partial\Omega.
$$
 (11)

We define the operator

$$
\mathcal{M}:[0,1]\times W^{1,4}(\Omega)\longrightarrow W^{2,2}(\Omega)\cap W^{1,2}_0(\Omega)
$$

as follows. For all $\sigma \in [0,1]$ and $y \in W^{1,4}(\Omega)$ consider the problem

$$
a(x, u, Du, D2 z) = \sigma [\tau F(x) - b(x) |Dy|2 + f2(x)y] \quad \text{a.e. in } \Omega \}
$$

$$
z = 0
$$
 (12)

In order to ensure solvability of this problem we need to show that the right-hand side of the equation above belongs to $L^2(\Omega)$. In fact, $F \in L^2(\Omega)$ and $b \in L^{\infty}(\Omega)$ side of the equation above belongs to $L^2(\Omega)$. In fact, $F \in L^2(\Omega)$ and $b \in L^{\infty}(\Omega)$
as it was mentioned. Further on, $y \in W^{1,4}(\Omega)$ and thus $|Dy|^2 \in L^2(\Omega)$. Finally,
 $y \in W^{1,4}(\Omega) \subset C^0(\overline{\Omega})$ by virtue of Sobolev's i $y \in W^{1,4}(\Omega) \subset C^{0}(\overline{\Omega})$ by virtue of Sobolev's imbedding theorem and therefore

$$
\int_{\Omega} f_2^2(x) y^2(x) dx \leq \left(\sup_{\Omega} |y(x)|\right)^2 \int_{\Omega} |f_2(x)|^2 dx < \infty.
$$

According to [4: Theorem 3] or [3: Theorem 4.4] and Campanato's condition (A) of ellipticity, problem (12) has a unique solution $z \in W^{2,2}(\Omega) \cap W_0^{1,2}(\Omega)$. This way we defined an operator $\int_{\Omega}^{2}(x)y^{2}(x) dx \leq (\sup_{\Omega}|y(x)|)^{2} \int_{\Omega}|f_{2}(x)|^{2} dx$

eorem 3] or [3: Theorem 4.4] and Campana

12) has a unique solution $z \in W^{2,2}(\Omega) \cap W$
 $\mathcal{M}: [0,1] \times W^{1,4}(\Omega) \longrightarrow W^{2,2}(\Omega) \cap W^{1,2}_{0}(\Omega)$
 $\langle y, y \rangle = z$. It is easily seen

$$
\mathcal{M}:[0,1]\times W^{1,4}(\Omega)\longrightarrow W^{2,2}(\Omega)\cap W^{1,2}_0(\Omega)
$$

by the formula $\mathcal{M}(\sigma, y) = z$. It is easily seen that each fixed point of the operator $\mathcal{M}(1, \cdot)$ is a solution of problem (12). The existence of such fixed point will follow from Leray-Schauder's theorem. The condition $a(x, z, p, 0) = 0$ as required above shows that $\mathcal{M}(0, y) = 0$ for each $y \in W^{1,4}(\Omega)$. The operator *M* is a continuous one as it is proved in $[8]$. Moreover, M is a compact operator considering it as a mapping from $[0,1] \times W^{1,4}(\Omega)$ imbedded into $W^{1,4}(\Omega)$ (Rellich's theorem). $W^{1,4}(\Omega)$. The operator M is a continuous one as it is
pact operator considering it as a mapping from $[0,1]$:
sertion is a consequence of the fact that $W^{2,2}(\Omega)$ is Ω
Rellich's theorem).
a priori estimate with a

[8]. Moreover, M is a compact operator considering it as a mapping from $[0,1] \times W^{1,4}(\Omega)$
into $W^{1,4}(\Omega)$. The last assertion is a consequence of the fact that $W^{2,2}(\Omega)$ is compactly
imbedded into $W^{1,4}(\Omega)$ (Rellich Finally, (10) gives an a priori estimate with a constant independent of v_{τ} and σ for each solution $v_r \in W^{2,2}(\Omega) \cap W_0^{1,2}(\Omega) \subset W^{1,4}(\Omega)$ of the equation $\mathcal{M}(\sigma, v_r) = v_r$ which is equivalent to the Dirichlet problem

$$
a(x, u, Du, D^2 v_\tau) = \sigma \{ \tau F(x) - b(x) |D v_\tau|^2 + f_2(x) v_\tau \} \quad \text{a.e. in } \Omega \} \qquad (13)
$$

$$
v_\tau = 0 \qquad \text{on } \partial \Omega.
$$

Hence Leray-Schauder's theorem implies the existence of a fixed point of $\mathcal{M}(1, \cdot)$ which is a solution of problem (4) with $\rho = \tau$. This completes the proof of Theorem 1

The proof of the existence result (Theorem 2) is similar to the proof of [8: Theorem 1) and it makes use of Leray-Schauder's fixed point principle. However, in addition to the gradient estimate (2) we need an a priori bound for $||u||_{L^{\infty}}(\Omega)$.

Proposition 5. Let conditions (A) and (C) hold. Then each solution $u \in W^{2,2}(\Omega) \cap$ $W_0^{1,2}(\Omega)$ of problem (1) satisfies the estimate

$$
||u||_{L^{\infty}(\Omega)} \leq M + R \operatorname{diam}\Omega
$$

where *R* is such that $\int_{B_R} h(p) dp = \int_{\Omega} g(x) dx$ and B_R is a ball with center at the origin and *radius R.* **Proof.** Since $a(x, z, p, 0) = 0$, the function $u \in W_0^{1,2}(\Omega) \cap W^{2,2}(\Omega)$ solves the proof. Since $a(x, z, p, 0) = 0$, the function $u \in W_0^{1,2}(\Omega) \cap W^{2,2}(\Omega)$ solves the plem

problem

conditions (A) and (C) hold. Then each
atisfies the estimate

$$
||u||_{L^{\infty}(\Omega)} \leq M + R \operatorname{diam}\Omega
$$

$$
h(p) dp = \int_{\Omega} g(x) dx \text{ and } B_R \text{ is a ball}
$$

$$
p, 0) = 0, \text{ the function } u \in W_0^{1,2}(\Omega)
$$

$$
a^{ij}(x)D_{ij}u = f(x, u, Du) \text{ a.e. in } \Omega
$$

$$
u = 0 \text{ on } \partial\Omega
$$

where $a^{ij} \in L^{\infty}(\Omega)$,

$$
a^{ij}(x) = \int_0^1 \frac{\partial a}{\partial \xi_{ij}}(x, u(x), Du(x), sD^2 u(x)) ds
$$

(see [8: Lemma]). Hence, the statement of Proposition 5 follows from condition (C) and $[10:$ Theorem 2.6.1
