

# Dominated Bilinear Forms and 2-homogeneous Polynomials

by

Geraldo BOTELHO, Daniel PELLEGRINO and Pilar RUEDA

## Abstract

The main goal of this note is to establish a connection between the cotype of the Banach space  $X$  and the parameters  $r$  for which every 2-homogeneous polynomial on  $X$  is  $r$ -dominated. Let  $\text{cot } X$  be the infimum of the cotypes assumed by  $X$  and  $(\text{cot } X)^*$  be its conjugate. The main result of this note asserts that if  $\text{cot } X > 2$ , then for every  $1 \leq r < (\text{cot } X)^*$  there exists a non- $r$ -dominated 2-homogeneous polynomial on  $X$ .

*2010 Mathematics Subject Classification:* 46G25, 46B20, 46B28.

*Keywords:*  $r$ -dominated multilinear form,  $r$ -dominated homogeneous polynomial, absolutely  $(p; q)$ -summing mapping, cotype.

## §1. Introduction

The notion of  $p$ -dominated multilinear mappings and homogeneous polynomials between Banach spaces plays an important role in the nonlinear theory of absolutely summing operators. It was introduced by Pietsch [17] and has been investigated by several authors since then (see, e.g., [5, 6] and references therein).

Let  $X$  be a Banach space and  $m$  be a positive integer. A continuous  $m$ -linear form  $A$  on  $X^m$  is  $r$ -dominated if  $(A(x_j^1, \dots, x_j^m))_{j=1}^\infty \in \ell_{r/m}$  whenever  $(x_j^1)_{j=1}^\infty, \dots, (x_j^m)_{j=1}^\infty$  are weakly  $r$ -summable in  $X$ . In a similar way, a scalar-valued  $m$ -homogeneous polynomial  $P$  on  $X$  is  $r$ -dominated if  $(P(x_j))_{j=1}^\infty \in \ell_{r/m}$  whenever  $(x_j)_{j=1}^\infty$  is weakly  $r$ -summable in  $X$ .

In [11, Lemma 5.4] it is proved that for every infinite-dimensional Banach space  $X$ , every  $p \geq 1$  and every  $m \geq 3$ , there exists a continuous non- $p$ -dominated  $m$ -linear form on  $X^m$ . For polynomials the question has recently been settled in [6], where it is proved that for every infinite-dimensional Banach space  $X$ , every  $p \geq 1$  and every  $m \geq 3$ , there exists a continuous non- $p$ -dominated scalar-valued  $m$ -homogeneous polynomial on  $X$ . So, coincidence situations can occur only for  $m = 2$ . Sometimes it happens that every continuous bilinear form on  $X^2$  is 2-dominated, for example if  $X$  is either an  $\mathcal{L}_\infty$ -space, the disc algebra  $\mathcal{A}$  or the Hardy space  $H^\infty$  (see [4, Proposition 2.1]). In this case every continuous bilinear form on  $X^2$  and every continuous scalar-valued 2-homogeneous polynomial on  $X$  are  $r$ -dominated for every  $r \geq 2$ . But what about  $r$ -dominated bilinear forms and 2-homogeneous polynomials for  $1 \leq r < 2$ ?

Those spaces  $X$  that enjoy the property that all bilinear forms on  $X^2$  are 1-dominated are all of cotype 2 (Example 1). In Proposition 3.2 we see that having cotype  $2 + \varepsilon$  for every  $\varepsilon > 0$  is a necessary condition. So, for a space  $X$  such that  $\text{cot } X > 2$  it is natural to investigate how close  $r$  can be to 1 with the property that every bilinear form on  $X^2$  (or 2-homogeneous polynomial on  $X$ ) is  $r$ -dominated. For bilinear forms it is not difficult to see (Proposition 3.3) that  $(\text{cot } X)^*$ , the conjugate of the number  $\text{cot } X$ , is the closest  $r$  can be to 1. As usual, for polynomials the situation is more delicate. In the main result of this paper, Theorem 3.2, we prove that the estimate  $(\text{cot } X)^*$  holds for 2-homogeneous polynomials as well. We also point out that this result is in a sense sharp.

## §2. Notation

Throughout this paper,  $n$  and  $m$  are positive integers, and  $X$  and  $Y$  will stand for Banach spaces over  $\mathbb{K} = \mathbb{R}$  or  $\mathbb{C}$ . The Banach spaces of all continuous  $m$ -linear mappings  $A: X^m \rightarrow Y$  and continuous  $m$ -homogeneous polynomials  $P: X \rightarrow Y$ , endowed with the usual sup norms, are denoted by  $\mathcal{L}^m(X; Y)$  and  $\mathcal{P}^m(X; Y)$ , respectively ( $\mathcal{L}(X; Y)$  if  $m = 1$ ). When  $m = 1$  and  $Y = \mathbb{K}$  we write  $X^*$  to denote the topological dual of  $X$ . The closed unit ball of  $X$  is represented by  $B_X$ . The notation  $\text{cot } X$  denotes the infimum of the cotypes assumed by  $X$ . The identity operator on  $X$  is denoted by  $\text{id}_X$ . For details on the theory of multilinear mappings and homogeneous polynomials between Banach spaces we refer to [10, 14].

Given  $r \in [0, \infty)$ , let  $\ell_r(X)$  be the Banach ( $r$ -Banach if  $0 < r < 1$ ) space of all absolutely  $r$ -summable sequences  $(x_j)_{j=1}^\infty$  in  $X$  with the norm  $\|(x_j)_{j=1}^\infty\|_r = (\sum_{j=1}^\infty \|x_j\|^r)^{1/r}$ . We denote by  $\ell_r^w(X)$  the Banach ( $r$ -Banach if  $0 < r < 1$ ) space of all weakly  $r$ -summable sequences  $(x_j)_{j=1}^\infty$  in  $X$  with the norm  $\|(x_j)_{j=1}^\infty\|_{w,r} = \sup_{\varphi \in B_{X^*}} \|(\varphi(x_j))_{j=1}^\infty\|_r$ .

Let  $p, q > 0$ . An  $m$ -linear mapping  $A \in \mathcal{L}(^m X; Y)$  is *absolutely  $(p; q)$ -summing* if  $(A(x_j^1, \dots, x_j^m))_{j=1}^\infty \in \ell_p(Y)$  whenever  $(x_j^1)_{j=1}^\infty, \dots, (x_j^m)_{j=1}^\infty \in \ell_q^w(X)$ . It is well-known that  $A$  is absolutely  $(p; q)$ -summing if and only if there is a constant  $C \geq 0$  such that

$$\left( \sum_{j=1}^n \|A(x_j^1, \dots, x_j^m)\|^p \right)^{1/p} \leq C \prod_{k=1}^m \|(x_j^k)_{j=1}^n\|_{w, q}$$

for every positive integer  $n$  and every  $x_1^k, \dots, x_n^k \in X, k = 1, \dots, m$ . The infimum of such  $C$  is denoted by  $\|A\|_{\text{as}(p; q)}$ . The space of all absolutely  $(p; q)$ -summing  $m$ -linear mappings from  $X^m$  to  $Y$  is denoted by  $\mathcal{L}_{\text{as}(p; q)}(^m X; Y)$ , and  $\|\cdot\|_{\text{as}(p; q)}$  is a complete norm ( $p$ -norm if  $p < 1$ ) on  $\mathcal{L}_{\text{as}(p; q)}(^m X; Y)$ .

An  $m$ -homogeneous polynomial  $P \in \mathcal{P}(^m X; Y)$  is *absolutely  $(p; q)$ -summing* if the symmetric  $m$ -linear mapping associated to  $P$  is absolutely  $(p; q)$ -summing, or, equivalently, if  $(P(x_j))_{j=1}^\infty \in \ell_p(Y)$  whenever  $(x_j)_{j=1}^\infty \in \ell_q^w(X)$ . It is well-known that  $P$  is absolutely  $(p; q)$ -summing if and only if there is a constant  $C \geq 0$  such that

$$\left( \sum_{j=1}^n \|P(x_j)\|^p \right)^{1/p} \leq C (\|(x_j)_{j=1}^n\|_{w, q})^m$$

for every positive integer  $n$  and every  $x_1, \dots, x_n \in X$ . The infimum of such  $C$  is denoted by  $\|P\|_{\text{as}(p; q)}$ . The space of all absolutely  $(p; q)$ -summing  $m$ -homogeneous polynomials from  $X$  to  $Y$  is denoted by  $\mathcal{P}_{\text{as}(p; q)}(^m X; Y)$ , and  $\|\cdot\|_{\text{as}(p; q)}$  is a complete norm ( $p$ -norm if  $p < 1$ ) on  $\mathcal{P}_{\text{as}(p; q)}(^m X; Y)$ .

An  $m$ -homogeneous polynomial  $P \in \mathcal{P}(^m X; Y)$  is said to be  *$r$ -dominated* if it is absolutely  $(r/m; r)$ -summing. In this case we write  $\mathcal{P}_{d, r}(^m X; Y)$  and  $\|\cdot\|_{d, r}$  instead of  $\mathcal{P}_{\text{as}(r/m; r)}(^m X; Y)$  and  $\|\cdot\|_{\text{as}(r/m; r)}$ . As usual we write  $\mathcal{P}_{d, r}(^m X)$  and  $\mathcal{P}(^m X)$  when  $Y = \mathbb{K}$ . The definition (and notation) for  $r$ -dominated multilinear mappings is analogous (for the notation just replace  $\mathcal{P}$  by  $\mathcal{L}$ ). For details we refer to [2, 4, 11].

### §3. Results

First we establish the existence of Banach spaces on which every bilinear form (hence every scalar-valued 2-homogeneous polynomial) is 1-dominated. By  $X \tilde{\otimes}_\pi X$  and  $X \tilde{\otimes}_\varepsilon X$  we mean the completions of the tensor product  $X \otimes X$  with respect to the projective norm  $\pi$  and the injective norm  $\varepsilon$ , respectively. For the basics on tensor norms we refer to [8, 19].

By  $\Pi_r$  we denote the ideal of absolutely  $r$ -summing linear operators. The following well-known factorization theorem (see, e.g., [17, Theorem 14] or [2, Proposition 46(a)]) will be useful a couple of times.

**Lemma 3.1.**  $\mathcal{L}_{d,r}(^m X; Y) = \mathcal{L} \circ (\Pi_r, \overset{(m)}{\cdot}, \Pi_r)(^m X; Y)$  and  $\mathcal{P}_{d,r}(^m X; Y) = \mathcal{P} \circ \Pi_r(^m X; Y)$  for all positive integers  $m$  and Banach spaces  $X$  and  $Y$ .

**Proposition 3.1.** Let  $X$  be a cotype 2 space. Then  $X \tilde{\otimes}_\pi X = X \tilde{\otimes}_\varepsilon X$  if and only if  $\mathcal{L}_{d,1}(^2 X) = \mathcal{L}(^2 X)$ .

*Proof.* This result is contained, in essence, in [11]. We give the details for the sake of completeness.

Assume that  $X \tilde{\otimes}_\pi X = X \tilde{\otimes}_\varepsilon X$  and let  $A \in \mathcal{L}(^2 X)$ . Denoting the linearization of  $A$  by  $A_L$  we have  $A_L \in (X \tilde{\otimes}_\pi X)' = (X \tilde{\otimes}_\varepsilon X)'$ . Regarding  $X$  as a subspace of  $C(B_{X'})$  and using that  $\varepsilon$  respects the formation of subspaces,  $A_L$  admits a continuous extension to  $C(B_{X'}) \tilde{\otimes}_\varepsilon C(B_{X'})$ , hence to  $C(B_{X'}) \tilde{\otimes}_\pi C(B_{X'})$  because  $\varepsilon \leq \pi$ . As bilinear forms on  $C(K)$ -spaces are 2-dominated, the bilinear form associated to this extension is 2-dominated. But restrictions of 2-dominated bilinear forms are 2-dominated as well, so  $A$  is 2-dominated. Since 2-summing operators on cotype 2 spaces are 1-summing [9, Corollary 11.16(a)], it follows that  $\Pi_1(X; Y) = \Pi_2(X; Y)$  for every  $Y$ , so by Lemma 3.1 we have

$$\mathcal{L}_{d,2}(^2 X) = \mathcal{L} \circ (\Pi_2, \Pi_2)(^2 X) = \mathcal{L} \circ (\Pi_1, \Pi_1)(^2 X) = \mathcal{L}_{d,1}(^2 X).$$

It follows that  $A$  is 1-dominated.

Conversely, assume that  $\mathcal{L}_{d,1}(^2 X) = \mathcal{L}(^2 X)$  and let  $A \in \mathcal{L}(^2 X)$ . Since 1-dominated bilinear forms are 2-dominated, it follows that  $A$  is 2-dominated, hence extendible by [13, Theorem 23]. Adapting the proof of [7, Proposition 1.1] to bilinear forms we conclude that  $A$  is integral. Now apply [8, Ex. 4.12] to get  $X \tilde{\otimes}_\pi X = X \tilde{\otimes}_\varepsilon X$ .  $\square$

**Example 1.** Pisier [18] proved that every cotype 2 space  $E$  embeds isometrically in a cotype 2 space  $X$  such that  $X \tilde{\otimes}_\pi X = X \tilde{\otimes}_\varepsilon X$ . So for every such space  $X$  we have  $\mathcal{L}_{d,1}(^2 X) = \mathcal{L}(^2 X)$ .

It is easy to see that  $\text{cot } X = 2$  is a necessary condition for every bilinear form on  $X$  to be 1-dominated:

**Proposition 3.2.** If  $\mathcal{L}_{d,1}(^2 X) = \mathcal{L}(^2 X)$ , then  $\text{cot } X = 2$ .

*Proof.* By [1, Lemma 3.4] every bounded linear operator from  $X$  to  $X'$  is 1-summing. So, from [12, Proposition 8.1(2)] we conclude that the identity operator on  $X$  is (2;1)-summing. It follows that  $\text{cot } X = 2$  by [9, Theorem 14.5].  $\square$

Let  $X$  be such that  $\text{cot } X > 2$ . Since we cannot have  $\mathcal{L}_{d,1}(^2 X) = \mathcal{L}(^2 X)$ , for which  $r > 1$  is it possible to have  $\mathcal{L}_{d,r}(^2 X) = \mathcal{L}(^2 X)$ ? Or, at least,  $\mathcal{P}_{d,r}(^2 X) =$

$\mathcal{P}(^2X)$ ? In other words, we seek estimates for the numbers

$$\mathcal{L}_X := \inf\{r : \mathcal{L}_{d,r}(^2X) = \mathcal{L}(^2X)\} \quad \text{and} \quad \mathcal{P}_X := \inf\{r : \mathcal{P}_{d,r}(^2X) = \mathcal{P}(^2X)\}.$$

It is not difficult to give a lower bound for  $\mathcal{L}_X$ . By  $q^*$  we denote the conjugate exponent of  $q > 1$ .

**Proposition 3.3.** *If  $\cot X > 2$ , then  $\mathcal{L}_X \geq (\cot X)^*$ .*

*Proof.* By Proposition 3.2 we know that  $\mathcal{L}_{d,1}(^2X) \neq \mathcal{L}(^2X)$ . Using the equality  $\Pi_1(X; Y) = \Pi_r(X; Y)$  whenever  $1 \leq r < (\cot X)^*$  [9, Corollary 11.16(b)] and Lemma 3.1, we find that

$$\mathcal{L}_{d,r}(^2X) = \mathcal{L} \circ (\Pi_r, \Pi_r)(^2X) = \mathcal{L} \circ (\Pi_1, \Pi_1)(^2X) = \mathcal{L}_{d,1}(^2X) \neq \mathcal{L}(^2X)$$

for every  $1 \leq r < (\cot X)^*$ , so the result follows. □

It is not clear at once that the same holds for polynomials. Here the situation is usually more delicate: for instance, in [6] one can find a non- $r$ -dominated bilinear form whose associated 2-homogeneous polynomial happens to be  $r$ -dominated. However, we shall prove in Theorem 3.2 that again  $\mathcal{P}_X \geq (\cot X)^*$ .

The following proof extends an argument which was first used in this context in [15].

**Theorem 3.1.** *Let  $m$  be an even positive integer and  $X$  be an infinite-dimensional real Banach space. If  $q < 1$  and  $\mathcal{P}_{as(q;r)}(^mX) = \mathcal{P}(^mX)$ , then  $\text{id}_X$  is absolutely  $(\frac{mq}{1-q}, r)$ -summing.*

*Proof.* The open mapping theorem gives us a constant  $K > 0$  such that  $\|Q\|_{as(q;r)} \leq K\|Q\|$  for all continuous  $m$ -homogeneous polynomials  $Q: X \rightarrow Y$ .

Let  $n \in \mathbb{N}$  and  $x_1, \dots, x_n \in X$  be given. Consider  $x_1^*, \dots, x_n^* \in B_{X^*}$  such that  $x_j^*(x_j) = \|x_j\|$  for every  $j = 1, \dots, n$ . Let  $\mu_1, \dots, \mu_n$  be real numbers with  $\sum_{j=1}^n |\mu_j|^s = 1$ , where  $s = 1/q$ . Define  $P: X \rightarrow \mathbb{R}$  by

$$P(x) = \sum_{j=1}^n |\mu_j|^{1/q} x_j^*(x)^m \quad \text{for every } x \in X.$$

Since  $m$  is even and  $\mathbb{K} = \mathbb{R}$ , it follows that  $P(x) \geq 0$  for every  $x \in X$ . Also,  $|P(x)| = P(x) \geq |\mu_k|^{1/q} x_k^*(x)^m$  for every  $x \in X$  and every  $k = 1, \dots, n$ . From

$$|P(x)| = \left| \sum_{j=1}^n |\mu_j|^{1/q} x_j^*(x)^m \right| \leq \|x\|^m \sum_{j=1}^n |\mu_j|^{1/q} = \|x\|^m$$

we conclude that  $\|P\|_{\text{as}(q;r)} \leq K\|P\| \leq K$ . So

$$\begin{aligned} \left(\sum_{j=1}^n \|x_j\|^{mq} |\mu_j|\right)^{1/q} &= \left(\sum_{j=1}^n (\|x_j\|^m |\mu_j|^{1/q})^q\right)^{1/q} \leq \left(\sum_{j=1}^n |P(x_j)|^q\right)^{1/q} \\ &\leq \|P\|_{\text{as}(q;r)} (\|x_j\|_{w,r}^n)^m. \end{aligned}$$

Observing that this last inequality holds whenever  $\sum_{j=1}^n |\mu_j|^s = 1$  and that  $\frac{1}{s} + \frac{1}{s/(s-1)} = 1$  we have

$$\begin{aligned} \left(\sum_{j=1}^n \|x_j\|^{\frac{s}{s-1}mq}\right)^{1/\frac{s}{s-1}} &= \sup\left\{\left|\sum_{j=1}^n \mu_j \|x_j\|^{mq}\right| : \sum_{j=1}^n |\mu_j|^s = 1\right\} \\ &\leq \sup\left\{\sum_{j=1}^n |\mu_j| \|x_j\|^{mq} : \sum_{j=1}^n |\mu_j|^s = 1\right\} \\ &\leq \|P\|_{\text{as}(q;r)}^q (\|x_j\|_{w,r}^n)^{mq} \leq K^q (\|x_j\|_{w,r}^n)^{mq}. \end{aligned}$$

It follows that

$$\left(\sum_{j=1}^n \|x_j\|^{\frac{s}{s-1}mq}\right)^{1/\frac{s}{s-1}} \leq K^{1/m} (\|x_j\|_{w,r}^n)^{mq}.$$

Since  $\frac{s}{s-1}mq = \frac{mq}{1-q}$ ,  $n$  and  $x_1, \dots, x_n \in X$  are arbitrary, we conclude that  $\text{id}_X$  is  $(\frac{mq}{1-q}; r)$ -summing.  $\square$

The following theorem holds for spaces over  $\mathbb{K} = \mathbb{R}$  or  $\mathbb{C}$ :

**Theorem 3.2.** *If  $\text{cot } X = q > 2$ , then  $\mathcal{P}_{d,r}(^2X) \neq \mathcal{P}(^2X)$  for  $1 \leq r < q^*$ , where  $q^*$  is the conjugate of  $q$ . In other words,  $\mathcal{P}_X \geq q^*$ .*

*Proof.* Real case: Let  $1 \leq r < q^*$ . Combining Lemma 3.1 and [9, Corollary 11.16(b)] it is immediate that  $\mathcal{P}_{d,r}(^2X) = \mathcal{P}_{d,1}(^2X)$ . If  $\mathcal{P}_{d,r}(^2X) = \mathcal{P}_{d,1}(^2X) = \mathcal{P}(^2X)$ , from Theorem 3.1 we could conclude that  $\text{id}_X$  is  $(2; 1)$ -summing, but this is impossible because  $\text{cot } X > 2$ .

Complex case: If  $X$  is a complex Banach space,  $\text{cot } X = q > 2$  and  $1 \leq r < q^*$ , then by [3, Lemma 3.1] we know that  $\text{cot } X_{\mathbb{R}} = q > 2$ , so there is a non- $r$ -dominated polynomial  $P \in \mathcal{P}(^2X_{\mathbb{R}})$ . Denoting by  $\tilde{P}$  the complexification of  $P$  we see that  $\tilde{P} \in \mathcal{P}(^2X)$  and following the lines of [16, Proposition 4.30] it is not difficult to prove that  $\tilde{P}$  fails to be  $r$ -dominated either.  $\square$

**Remark.** Let  $X$  be any of the spaces constructed by Pisier [18]. By Example 1 we know that  $\mathcal{P}_{d,1}(^2X) = \mathcal{P}(^2X)$ , which makes it clear that Theorem 3.2 is sharp in the sense that it is not valid for cotype 2 spaces.

**Conjecture.** We conjecture that if  $X$  is infinite-dimensional and  $\mathcal{L}_{d,1}({}^2X) = \mathcal{L}({}^2X)$ , then  $X \tilde{\otimes}_\pi X = X \tilde{\otimes}_\varepsilon X$ . Observe that for an infinite-dimensional space  $X$  with  $\mathcal{L}_{d,1}({}^2X) = \mathcal{L}({}^2X)$  and  $X \tilde{\otimes}_\pi X \neq X \tilde{\otimes}_\varepsilon X$ , if any, we should have:

- $X$  has no unconditional basis [4, Theorem 3.2];
- $X$  has cotype  $2 + \varepsilon$  for every  $\varepsilon > 0$  (Proposition 3.2);
- $X$  does not have cotype 2 (Proposition 3.1);
- $X'$  is a GT space [11, Theorem 3.4];
- every linear operator from  $X$  to  $X'$  is absolutely 1-summing (by [1, Lemma 3.4] this is a consequence of  $\mathcal{L}_{d,1}({}^2X) = \mathcal{L}({}^2X)$ ), in particular  $X$  is Arens-regular;
- not every linear operator from  $X$  to  $X'$  is integral (this is a consequence of  $X \tilde{\otimes}_\pi X \neq X \tilde{\otimes}_\varepsilon X$ ).
